### Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q10-Q15):

#### NEW QUESTION # 10

What is the primary advantage of the Cisco Intersight cloud-based approach compared to traditional on-premises management tools?

- A. It provides faster hardware upgrades
- B. It offers better integration with non-Cisco products
- **C. It allows management from anywhere without on-premises software**
- D. It requires less local storage

**Answer: C**

Explanation:

The main advantage of Cisco Intersight is its cloud-based architecture, which allows IT administrators to manage infrastructure from any location without needing to install or maintain traditional on-premises management tools.

This provides:

Centralized visibility and control over UCS servers and HyperFlex infrastructure  
 Remote firmware upgrades and configuration  
 Policy-driven automation  
 Unlike on-premises tools, Intersight eliminates the overhead of maintaining dedicated infrastructure for management.

#### NEW QUESTION # 11

Which function does the Stack Port 1 serve on a Cisco Meraki switch?

- A. It connects to the Stack Port 2 of the previous switch in a stack configuration.
- B. It connects to the Stack Port 2 of the next switch in a stack configuration.
- C. It provides a dedicated uplink to the Meraki cloud for management.
- **D. It serves as a high-speed interconnect for clustered switches.**

**Answer: D**

Explanation:

On Cisco Meraki switches, Stack Port 1 (along with Stack Port 2) is used to form a physical stacking connection between multiple switches. These stack ports are dedicated high-speed interconnects that enable multiple switches to operate as a single logical switch.

The stacking topology depends on the number of switches, but Stack Port 1 serves as one side of this high-speed inter-switch communication channel - not for management or cloud access.

#### NEW QUESTION # 12

Which two components are accessed by removing the chassis cover on Cisco Catalyst 8000 Series Edge platforms? (Choose two.)

- A. DIMMs
- B. Transceivers
- C. Network Interface Modules
- D. SSDs
- E. Fan trays

**Answer: A,D**

Explanation:

On Cisco Catalyst 8000 Series Edge platforms, removing the chassis cover provides access to internal components such as DIMMs (Dual In-line Memory Modules) and SSDs (Solid-State Drives). These components are located internally and require the removal of the chassis cover for maintenance or replacement.

DIMMs are used for system memory and are essential for the router's operation.

SSDs provide storage for system software and configurations.

Other components like Network Interface Modules (NIMs) and transceivers are typically accessible externally and do not require chassis cover removal.

#### NEW QUESTION # 13

What is a feature of Cisco Meraki switches that simplifies the replacement process?

- A. Cloud-based management
- B. Automatic hardware detection
- C. Offline configuration backup
- D. Built-in configuration wizard

**Answer: A**

Explanation:

Cloud-based management is a core feature of Cisco Meraki switches and significantly simplifies the device replacement process.

When a failed switch is replaced:

\* The new hardware can be claimed in the Meraki dashboard.

\* The previously assigned configuration is automatically applied to the replacement device.

\* This eliminates the need for local reconfiguration and ensures continuity with minimal manual effort.

This centralized approach ensures that configurations are stored securely and consistently applied across devices.

#### NEW QUESTION # 14

Which Layer 2 technology extends to access layer devices, allowing individual switch ports to be assigned for network and traffic management in an enterprise network?

- A. OSPF
- B. VLANs
- C. BGP
- D. MPLS

**Answer: B**

### Explanation:

In an enterprise network, Virtual Local Area Networks (VLANs) are the key Layer 2 technology used to logically segment a network into multiple broadcast domains. VLANs allow network administrators to assign individual switch ports to specific VLANs, enabling effective network segmentation and traffic management.

This configuration extends to access layer devices, such as switches where end-user devices connect. By isolating traffic into VLANs, administrators can improve network performance, enhance security by separating sensitive departments (such as finance and HR), and simplify network management.

Unlike routing protocols such as BGP and OSPF, which operate at Layer 3, or MPLS, which is a Layer 2.5 forwarding technology used primarily in service provider networks, VLANs are explicitly designed for Layer 2 segmentation within LAN environments.
