INF-306 Reliable Test Notes & INF-306 Books PDF

As a IT worker sometime you may know you will take advantage of new technology more quickly by farming out computer operations, we prefer to strengthen own strong points. Our INF-306 test braindump materials is popular based on that too. As we all know the passing rate for IT exams is low, the wise choice for candidates will select valid INF-306 test braindump materials to make you pass exam surely and fast. Professional handles professional affairs.

IT Specialist HTML5 Application Development Sample Questions (Q17-Q22):

NEW QUESTION # 17

You need to display the following user interface:

Motorcycle

Truck

Boat

Car

Bicycle

Complete the markup by selecting the correct option from each drop-down list.

```
<input list="vehicles" id="vehicle">
```

```
< [dropdown] id = " [dropdown]" >
```

First drop-down options

```
ul
li
ol
select
datalist
```

Second drop-down options

```
vehicle
vehicles
```

TestPassKing

```
<option value="Motorcycle"/>
<option value="Truck"/>
<option value="Boat"/>
<option value="Car"/>
<option value="Bicycle"/>
```

```
[dropdown]
```

Third drop-down options

```
</ul>
</li>
</ol>
</select>
</datalist>
```

Answer:

Explanation:

```
<input list="vehicles" id="vehicle">
```

```
<input type="text" id="vehicle" value="vehicles" />
```

First drop-down options

```
ul
li
ol
select
datalist
```

Second drop-down options

```
vehicle
vehicles
```

```
<option value="Motorcycle"/>
```

```
<option value="Truck"/>
```

```
<option value="Boat"/>
```

```
<option value="Car"/>
```

```
<option value="Bicycle"/>
```

```
<input type="text" value="vehicles" />
```

Third drop-down options

```
</ul>
</li>
</ol>
</select>
</datalist>
```

Explanation:

First drop-down: datalist

Second drop-down: vehicles

Third drop-down: </datalist >

The correct element is <datalist > because the interface requires a text input that provides selectable suggestions while still allowing the user to type. The <input > element uses list= " vehicles " , so it must be connected to a < datalist > element whose id is exactly vehicles. The id cannot be vehicle, because vehicle is already the input element's own identifier and does not match the value used by the list attribute. The < option

> elements inside the datalist define the suggested values: Motorcycle, Truck, Boat, Car, and Bicycle. ul, ol, and li are list-markup elements and do not create input suggestions. select would create a fixed dropdown list, but it would not match the editable input-with-suggestions behavior shown. The closing tag must match the opening datalist element, so the final selection is </datalist > .

NEW QUESTION # 18

Which two functions support 2D transformations in CSS3? Choose 2.

- A. scroll()
- B. move()
- C. skew()
- D. matrix()

Answer: C,D

Explanation:

The correct transformation functions are `matrix()` and `skew()`. CSS transformations are applied with the `transform` property and accept transform functions that alter an element's rendered appearance in two- dimensional or three-dimensional space. MDN defines `< transform-function >` as a data type representing a transformation that can rotate, resize, distort, or move an element in 2D or 3D space. The `matrix()` function is valid because it defines a homogeneous two-dimensional transformation matrix, allowing translation, scaling, rotation, and skewing effects to be represented numerically in one function. The `skew()` function is also valid because it explicitly skews an element on the 2D plane. `scroll()` is not a CSS transform function; scrolling is handled through overflow behavior or scrolling APIs. `move()` is also not a valid CSS transform function; the standard transform function for movement is `translate()`. References/topics: CSS3 transforms, transform property, 2D transformation functions, `matrix()`, `skew()`.

NEW QUESTION # 19

Which two statements correctly describe media queries? Choose 2.

- A. Media queries improve the performance of your web page.
- B. Media queries allow you to apply different CSS rules on various screens/breakpoints.
- C. Media queries support responsive web design.
- D. Media queries can process JavaScript code dynamically.

Answer: B,C

Explanation:

Media queries support responsive web design and allow different CSS rules to be applied at different screen sizes, device characteristics, or breakpoints. MDN describes media queries as a CSS mechanism for applying styles depending on media type and device or viewport characteristics, including width, height, resolution, and orientation. This is the foundation of responsive design because a page can adapt its layout for phones, tablets, laptops, and desktop displays without changing the HTML document. Breakpoints are the points where the design changes; MDN identifies them as the points where a media query is introduced to improve layout behavior across viewport sizes. Statement A is not generally correct because media queries are primarily a styling and layout mechanism, not a direct performance optimization. They can sometimes help avoid unsuitable layouts, but performance improvement is not their defining purpose. Statement D is incorrect because media queries are CSS rules; they do not execute or dynamically process JavaScript code. References /topics: responsive design, CSS media queries, viewport width, breakpoints, adaptive layout rules.

NEW QUESTION # 20

You need to create the layout shown, which defines five content areas:

- * Logo and page title
- * Menu
- * Main content area
- * Additional content area
- * Copyright and contact information

You define the following classes:

- A. `.grid-container { display: grid; grid-template-areas: " heading heading heading heading heading heading
" " menu content content content right right " " menu contact contact contact contact contact " ; grid- gap: 10px; background-color: orange; padding: 10px; }`
- B. `.grid-container { display: grid; grid-template-columns: " heading heading heading heading heading heading " " menu content content content right right " " menu contact contact contact contact contact " ; grid-gap: 10px; background-color: orange; padding: 10px; }`
- C. `.grid-container { display: grid; grid-template-rows: " heading heading heading heading heading heading
" " menu content content content right right " " menu contact contact contact contact contact " ; grid- gap: 10px; background-`

color: orange; padding: 10px;}

- D. `.grid-container { display: grid; grid-template-columns: 33% 33% 33%; grid-template-rows: 300px 500px 300px; grid-gap: 10px; background-color: orange; padding: 10px;}`

Answer: A

Explanation:

The correct answer is D because the layout shown is a named-area CSS Grid layout. The mockup contains five semantic regions: the top header area for the logo and page title, a left-side menu, a central main content area, a right-side additional content area, and a bottom copyright/contact area. In CSS Grid, this type of visual structure is defined with grid-template-areas, where each quoted string represents one grid row and each repeated name represents how far that area spans across columns. In option D, heading spans the full top row, menu occupies the left column across the lower rows, content fills the main center region, right fills the additional content region, and contact spans the bottom row to the right of the menu. Option A only defines row and column sizes and does not name the five content areas. Options B and C are invalid for this purpose because named layout strings do not belong in grid-template-rows or grid-template-columns. References

/topics: CSS Grid, grid containers, display: grid, named grid areas, grid-template-areas, page layout construction.

NEW QUESTION # 21

The following form is missing validation attributes:

```
< form >
< div class= " container " >
< h1 > Register Here < /h1 >
< p > Please fill in the details to create an account with us. < /p >
< hr >
< label for= " ? " > < b > Enter Email < /b > < /label >
< input type= " ? " placeholder= " Enter Email " name= " ? " placeholder= " username@domain.com " >
< label for= " ? " > < b > Password < /b > < /label >
< input type= " ? " placeholder= " Enter Password " name= " ? " >
< label for= " ? " > < b > Confirm Password < /b > < /label >
< input type= " ? " placeholder= " Confirm Password " name= " ? " >
< label for= " phone " > < b > Phone < /b > < /label >
< input type= " tel " id= " phone " name= " phone " placeholder= " 123-45-678 " >
< hr >
< p > By creating an account you agree to our < a href= " # " > Terms & Privacy < /a > . < /p >
< button type= " submit " class= " registerbtn " > < strong > Register < /strong > < /button >
< /div >
< /form >
```

You need to update the form to enforce the following requirements for visitors:

- * All fields must be completed with valid information.
- * The users should not be allowed to type passwords longer than 8 characters.
- * Passwords must use only numbers and letters.
- * Phone numbers and email addresses must follow the configuration of the placeholder text.
- * The browser must display an error message that makes it clear what type of input change is needed.

Review the markup on the left.

Complete the sentences by selecting the correct option from each drop-down list.

Note: You will receive partial credit for each correct selection.

The required attribute is needed for of the input elements.

- one
- two
- three
- four

The password and phone fields require attributes.

- max
- maxlength
- min and max
- minlength and maxlength

A completed pattern attribute is needed for the fields.

- email
- password
- phone
- password and phone
- email, password, and phone

Answer:

Explanation:

The required attribute is needed for of the input elements.

one
two
three
four

The password and phone fields require attributes.

max
maxlength
min and max
minlength and maxlength

A completed pattern attribute is needed for the fields.

email
password
phone
password and phone
email, password, and phone

Explanation:

First drop-down: four

Second drop-down: maxlength

Third drop-down: email, password, and phone

The form contains four user-entry input elements: email, password, confirm password, and phone. Since the requirements state that all fields must be completed, the required attribute must be applied to all four inputs.

The password field must prevent entries longer than eight characters, so the correct length-control attribute is maxlength, not max; max applies to numeric/date-style value ranges, while maxlength limits character count in text-style inputs. The phone field also benefits from maxlength because its placeholder format has a fixed visible structure. Finally, completed pattern attributes are needed for email, password, and phone because each has a required format rule: the email must match the placeholder-style address format, the password must use only letters and numbers, and the phone number must follow the placeholder format such as 123-45-678. The title attribute should accompany these patterns to produce meaningful browser validation messages.

NEW QUESTION # 22

.....

Additionally, all operating systems also support this format. The third format is the desktop INF-306 Practice Exam software. It is ideal for users who prefer offline INF-306 exam practice. This format is supported by Windows computers and laptops. You can easily install this software in your system to use it anytime to prepare for the examination.
