Thanks to modern technology, learning online gives people access to a wider range of knowledge, and people have got used to convenience of electronic equipment. As you can see, we are selling our SCS-C03 learning guide in the international market, thus there are three different versions of our SCS-C03 exam materials: PDF, Soft and APP versions. It is worth mentioning that, the simulation test of our SCS-C03 Study Guide is available in our software version. With the simulation test, all of our customers will get accustomed to the SCS-C03 exam easily, and pass the exam with confidence.

Amazon SCS-C03 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Incident Response: This domain addresses responding to security incidents through automated and manual strategies, containment, forensic analysis, and recovery procedures to minimize impact and restore operations.
Topic 2	<ul style="list-style-type: none"> Identity and Access Management: This domain deals with controlling authentication and authorization through user identity management, role-based access, federation, and implementing least privilege principles.
Topic 3	<ul style="list-style-type: none"> Infrastructure Security: This domain focuses on securing AWS infrastructure including networks, compute resources, and edge services through secure architectures, protection mechanisms, and hardened configurations.
Topic 4	<ul style="list-style-type: none"> Detection: This domain covers identifying and monitoring security events, threats, and vulnerabilities in AWS through logging, monitoring, and alerting mechanisms to detect anomalies and unauthorized access.

Amazon AWS Certified Security - Specialty Sample Questions (Q23-Q28):

NEW QUESTION # 23

AWS Config cannot deliver configuration snapshots to Amazon S3.
Which TWO actions will remediate this issue?

- A. Verify the IAM role has `s3:GetBucketAcl` and `s3:PutObject` permissions.
- B. Verify the S3 bucket policy allows `config.amazonaws.com`.
- C. Verify IAM policy allows AWS Config to write logs.
- D. Modify AWS Config API permissions.
- E. Verify the S3 bucket can assume the IAM role.

Answer: A,B

Explanation:

AWS Config requires permissions at two levels to deliver configuration data: the AWS Config service role and the S3 bucket policy. The AWS Certified Security - Specialty Study Guide states that the S3 bucket policy must explicitly allow the `config.amazonaws.com` service principal to write objects. Additionally, the IAM role used by AWS Config must allow `s3:GetBucketAcl` and `s3:PutObject`.

If either permission is missing, AWS Config cannot deliver snapshots and will log delivery errors in CloudTrail. This dual-permission model ensures least privilege while maintaining secure delivery of compliance data.

Other options reference incorrect principals or irrelevant permissions.

NEW QUESTION # 24

A company has configured an organization in AWS Organizations for its AWS accounts. AWS CloudTrail is enabled in all AWS Regions.

A security engineer must implement a solution to prevent CloudTrail from being disabled.

Which solution will meet this requirement?

- A. Create a service control policy (SCP) that includes an explicit `Deny` rule for the `cloudtrail:StopLogging` action and the `cloudtrail:DeleteTrail` action. Attach the SCP to the root OU.
- B. Create IAM policies for all the company's users to prevent the users from performing the `DescribeTrails` action and the `GetTrailStatus` action.
- C. Enable server-side encryption with AWS KMS keys (SSE-KMS) for CloudTrail logs. Create a KMS key. Attach a policy to the key to prevent decryption of the logs.
- D. Enable CloudTrail log file integrity validation from the organization's management account.

Answer: A

Explanation:

AWS CloudTrail is a foundational security service that records API activity and account events. According to the AWS Certified Security - Specialty Official Study Guide, the only way to centrally and reliably prevent CloudTrail from being disabled across multiple AWS accounts is by using AWS Organizations service control policies (SCPs).

SCPs define the maximum available permissions for all accounts in an organization or organizational unit. By creating an SCP with an explicit `Deny` for the `cloudtrail:StopLogging` and `cloudtrail:DeleteTrail` actions and attaching it to the root OU, the security engineer ensures that no principal in any member account—including administrators—can stop or delete CloudTrail trails. Explicit denies in SCPs cannot be overridden by IAM permissions.

Option A is incorrect because log file integrity validation only detects tampering after logs are delivered and does not prevent CloudTrail from being disabled. Option B protects log data at rest but does not prevent trail deletion or logging suspension. Option D removes read-only permissions and does not affect the ability to stop or delete CloudTrail.

AWS documentation explicitly states that SCPs are the recommended mechanism to enforce mandatory security controls such as CloudTrail logging across an organization, making this the correct and most secure solution.

NEW QUESTION # 25

A company needs centralized log monitoring with automatic detection across hundreds of AWS accounts.

Which solution meets these requirements with the LEAST operational effort?

- A. Stream logs to Kinesis and process with Lambda.
- B. Centralize CloudWatch logs and use Inspector.
- **C. Designate a GuardDuty administrator account and enable protections.**
- D. Centralize CloudTrail logs and query with Athena.

Answer: C

Explanation:

Amazon GuardDuty provides fully managed threat detection across accounts when configured with delegated administration. EKS and RDS protections enable workload-aware detection with minimal setup.

Other solutions require custom pipelines and higher operational overhead.

NEW QUESTION # 26

A company has AWS accounts in an organization in AWS Organizations. An Amazon S3 bucket in one account is publicly accessible. A security engineer must remove public access and ensure the bucket cannot be made public again. Which solution will meet these requirements?

- A. Enforce KMS encryption and deny s3:GetObject by SCP.
- B. Enable Object Lock governance and deny s3:PutPublicAccessBlock by SCP.
- **C. Enable PublicAccessBlock and deny s3:PutPublicAccessBlock by SCP.**
- D. Enable PublicAccessBlock and deny s3:GetObject by SCP.

Answer: C

Explanation:

Amazon S3 Block Public Access provides centralized controls to prevent public access through bucket policies and ACLs. AWS Certified Security - Specialty guidance recommends enabling Block Public Access to reduce accidental exposure and to enforce guardrails that override public grants. Enabling Block Public Access on the bucket removes current public exposure when combined with correcting policies/ACLs and prevents future misconfiguration. To ensure the bucket cannot be made public again, the security engineer must prevent principals from disabling Block Public Access. An SCP that denies s3:PutPublicAccessBlock prevents changes that would remove or weaken the PublicAccessBlock configuration, enforcing the guardrail across the OU or account. Options A and D do not directly address public exposure control. Option B denies object reads but does not ensure public access cannot be re-enabled; it also does not address the root misconfiguration pathways and could disrupt legitimate access patterns. Option C specifically combines the correct preventive control (PublicAccessBlock) with organizational enforcement to stop future reversal.

NEW QUESTION # 27

A company runs a global ecommerce website using Amazon CloudFront. The company must block traffic from specific countries to comply with data regulations.

Which solution will meet these requirements MOST cost-effectively?

- **A. Use CloudFront geo restriction to deny the countries.**
- B. Use AWS WAF geo match rules.
- C. Use AWS WAF IP match rules.
- D. Use geolocation headers in CloudFront.

Answer: A

Explanation:

Amazon CloudFront includes a built-in geo restriction feature that allows content to be allowed or denied based on the viewer's country. According to AWS Certified Security - Specialty documentation, CloudFront geo restriction is the most cost-effective method for country-based blocking because it does not require AWS WAF or additional rule processing.

AWS WAF geo match rules incur additional cost and are more appropriate when advanced inspection or layered security controls are required. IP-based blocking is impractical due to frequent IP changes.

Geolocation headers do not enforce access control.

CloudFront geo restriction is evaluated at the edge and efficiently blocks disallowed countries with minimal latency and cost.
