Cisco Automating and Programming Cisco Collaboration Solutions Sample Questions (Q118-Q123):

NEW QUESTION # 118
Refer to the exhibit. An engineer needs a script to immediately change the hostname of the target endpoint. The hostname must revert to the previous hostname after rebooting. Which command must be used?

```
from ncclient import manager

host = 'sandbox-iosxe-latest-1.cisco.com'
user = 'developer'
pasw = 'C1sco12345'
port = 830

with manager.connect(host=host, port=port, username=user, password=pasw,
hostkey_verify=False,
                     device_params={'name': 'iosxe'}) as mgr:
    config_to_apply = '''
        <config>
          <native xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-native">
            <hostname>new_hostname</hostname>
          </native>
        </config>'''
    <command>
    print(edited_config)
```

real4prep.com

- A. edited_config = mgr.edit_config(target='failover', config=config_to_apply)
- B. edited_config = mgr.edit_config(target='boot', config=config_to_apply)
- C. edited_config = mgr.edit_config(target='startup', config=config_to_apply)
- D. edited_config = mgr.edit_config(target='running', config=config_to_apply)

Answer: D

Explanation:
To change the configuration immediately but have it revert after a reboot, the configuration must be applied to the running datastore, not the startup (which persists across reboots). Changes to the running datastore are lost after a reboot unless they are also saved to startup.
