CrowdStrike CCCS-203b Reliable Exam Review, Reliable CCCS-203b Dumps

The GuideTorrent Free CrowdStrike CCCS-203b Sample Questions, allow you to enjoy the process of buying risk-free. This is a version of the exercises, so you can see the quality of the questions, and the value before you decide to buy. We are confident that GuideTorrent the CrowdStrike CCCS-203b sample enough you satisfied with the product. In order to ensure your rights and interests, GuideTorrent commitment examination by refund. Our aim is not just to make you pass the exam, we also hope you can

become a true IT Certified Professional. Help you get consistent with your level of technology and technical posts, and you can relaxed into the IT white-collar workers to get high salary.

CrowdStrike Certified Cloud Specialist Sample Questions (Q306-Q311):

NEW QUESTION # 306

You are using the CrowdStrike Cloud Infrastructure Entitlement Manager (CIEM) to audit cloud accounts. Which of the following accounts should be flagged for unnecessary access privileges?

- A. An account with "limited" access to staging resources used for development purposes.
- **B. An account with "write" access to storage buckets and "admin" access to IAM policies but only performs read operations.**
- C. An account with permissions scoped to the "least privilege" principle and limited to specific resources.
- D. An account with "read-only" permissions to production resources but no login activity in 90 days.

Answer: B

Explanation:

Option A: This account adheres to best practices for privilege management. It is unlikely to be flagged for unnecessary access privileges.

Option B: This account has unnecessary access privileges because its operations are limited to reading, yet it has higher permissions (write and admin). These excess privileges increase the attack surface and violate the principle of least privilege. This account should be reviewed and adjusted to remove unnecessary permissions.

Option C: While inactivity might warrant review, "read-only" permissions do not pose a significant risk in terms of access privilege misuse. This account would more likely be flagged for inactivity rather than unnecessary privileges.

Option D: This account aligns with the principle of least privilege and has access limited to a specific scope. It does not demonstrate unnecessary privileges.

NEW QUESTION # 307

What is the primary purpose of creating image assessment policies within Falcon Cloud Security?

- A. To create firewall rules for restricting network traffic between containers.
- B. To automate the deployment of container images across Kubernetes clusters.
- C. To configure runtime monitoring for containerized applications in production environments.
- **D. To evaluate container images for vulnerabilities and enforce security compliance during the CI/CD pipeline.**

Answer: D

Explanation:

Option A: Deployment automation is typically handled by CI/CD tools like Jenkins, GitLab CI, or Kubernetes itself, not by Falcon Cloud Security's image assessment policies.

Option B: Falcon Cloud Security's image assessment policies are designed to scan container images for vulnerabilities, misconfigurations, and other security risks before deployment. These policies help enforce compliance standards by preventing vulnerable or non-compliant images from being deployed, ensuring a secure container lifecycle from development to production.

Option C: Runtime monitoring is a separate capability that observes live workloads, whereas image assessment policies focus on pre-deployment scanning and compliance.

Option D: Firewall rules are configured at the network or Kubernetes level, typically using tools like Calico, AWS Security Groups, or Azure NSGs, not Falcon Cloud Security image assessment policies.

NEW QUESTION # 308

Which method allows you to identify running processes in a cloud environment without deploying a Falcon sensor?

- A. Utilizing CrowdStrike's Falcon Horizon to assess cloud workloads.
- B. Leveraging Falcon Insight's endpoint detection capabilities.
- **C. Using the Falcon Discover module to perform an agentless scan.**
- D. Deploying Falcon OverWatch to monitor the environment in real time.

Answer: C

Explanation:

Option A: Falcon Insight requires the installation of the Falcon sensor on endpoints to provide EDR capabilities. It cannot operate in agentless mode for runtime process discovery.

Option B: The Falcon Discover module enables organizations to perform agentless visibility of cloud workloads. It allows security teams to find what is running in the environment without deploying a Falcon sensor, making it particularly useful for runtime protection and initial assessments. This approach reduces the overhead of agent installation and provides instant visibility into unmanaged resources.

Option C: Falcon Horizon focuses on cloud posture management by identifying misconfigurations and compliance risks, not runtime visibility into processes or workloads. It does not offer runtime insights into active processes without a sensor.

Option D: Falcon OverWatch is a proactive threat hunting service that leverages Falcon Insight and related modules. It requires the deployment of sensors to function, making it unsuitable for environments without sensors.

NEW QUESTION # 309

You are setting up CrowdStrike to assess images in your container registry. What is the first step to establish a connection for image scanning?

- A. Register the image registry's credentials in the CrowdStrike Falcon console.
- B. Configure an API key in the CrowdStrike Falcon console and provide it to the image registry.
- C. Enable automatic image scanning in the image registry without additional configuration.
- D. Enable CrowdStrike image scanning through the cloud provider's default security settings.

Answer: A

Explanation:

Option A: Cloud provider default settings don't automatically support CrowdStrike integration. You need to explicitly configure and register the registry with CrowdStrike.

Option B: While API keys may be used for other integrations, the process of registering a connection involves providing the registry's credentials to CrowdStrike, not the other way around.

Option C: Automatic image scanning by the registry itself doesn't integrate with CrowdStrike. You must explicitly connect the registry to CrowdStrike for its scanning capabilities to be utilized.

Option D: To establish a connection for image scanning, you need to register the image registry in the CrowdStrike Falcon console. This involves providing the registry's credentials and configuration details, enabling CrowdStrike to access and scan images securely. This step establishes trust and ensures compatibility between the registry and CrowdStrike.

NEW QUESTION # 310

Which data sources does CrowdStrike CIEM primarily analyze to identify privileged accounts without multi-factor authentication (MFA)?

- A. Endpoint login logs collected by CrowdStrike Falcon.
- B. Firewall access control lists (ACLs) for privileged IP ranges.
- C. Cloud provider IAM policy configurations and MFA enforcement settings.
- D. Email activity logs from integrated cloud email platforms.

Answer: C

Explanation:

Option A: Falcon focuses on endpoint activity and threat detection, which is unrelated to IAM configurations or MFA enforcement. CIEM is tailored to cloud IAM analysis.

Option B: Email activity logs are unrelated to identifying privileged accounts or MFA enforcement.

CIEM focuses on cloud provider IAM policies and MFA settings to detect misconfigurations effectively.

Option C: Firewall ACLs are used to control network traffic and are not relevant to cloud IAM or MFA configurations. CIEM operates on IAM data and cloud provider configurations, not network-level settings.

Option D: CIEM analyzes IAM policy configurations to identify accounts with privileged roles and cross-references these findings with MFA enforcement settings to determine which accounts are not protected by MFA. This approach ensures precise detection of misconfigured accounts that could pose security risks.
