## Three in Demand Google Professional-Cloud-Developer Exam Questions Formats

In light of the truth that different people have various learning habits, we launch three Professional-Cloud-Developer training questions versions for your guidance. In addition, you can freely download the demo of Professional-Cloud-Developer learning materials for your consideration. We promise there will be no extra charges for such a try, on the contrary, we sincerely suggest you to try the demos of our Professional-Cloud-Developer Exam Questions and make a well-content choice. You will find that our Professional-Cloud-Developer training guide is worthy to buy for you time and money!

## Google Certified Professional - Cloud Developer Sample Questions (Q217-Q222):

### NEW QUESTION # 217

You have an application running in production on Cloud Run. Your team needs to change one of the application's services to return a new field. You want to test the new revision on 10% of your clients using the least amount of effort. What should you do to keep your service backward compatible?

- A. Replace the current service with the new revision. Deploy the new revision with no traffic allocated. After the deployment,

split the traffic between the previous service and the new revision.

- B. Update the current service with the new changes. Deploy the new revision with no traffic allocated. Split the traffic between the current service and the new revision.
- C. Replace the current service with the new revision. Deploy the new revision. Create a load balancer to split the traffic between the previous service and the new revision.
- D. Update the current service with the new changes. Deploy the new revision. After the deployment, split the traffic between the current service and the new revision.

**Answer: B**

Explanation:

**Backward Compatibility:** By updating the current service and deploying the new revision without allocating traffic initially, you ensure that the current functionality remains intact for all users.

**Traffic Splitting:** After deployment, you can easily configure traffic splitting between the current service and the new revision, allowing you to test the new field with 10% of your clients while the majority continue using the stable version.

**Ease of Implementation:** This approach minimizes disruptions and allows you to control the rollout gradually, which is essential for testing and validation.

### NEW QUESTION # 218

Your team is building an application for a financial institution. The application's frontend runs on Compute Engine, and the data resides in Cloud SQL and one Cloud Storage bucket. The application will collect data containing PII, which will be stored in the Cloud SQL database and the Cloud Storage bucket. You need to secure the PII data. What should you do?

- A. 1) Configure a private IP address for Cloud SQL  
2) Use VPC-SC to create a service perimeter  
3) Add the Cloud SQL database and the Cloud Storage bucket to different service perimeters
- B. 1) Create the relevant firewall rules to allow only the frontend to communicate with the Cloud SQL database  
2) Enable private access to allow the frontend to access the Cloud Storage bucket privately
- C. 1) Create the relevant firewall rules to allow only the frontend to communicate with the Cloud SQL database  
2) Using IAM, allow only the frontend service account to access the Cloud Storage bucket
- D. 1) Configure a private IP address for Cloud SQL  
2) Use VPC-SC to create a service perimeter  
3) Add the Cloud SQL database and the Cloud Storage bucket to the same service perimeter

**Answer: D**

### NEW QUESTION # 219

You are a developer at a large organization. Your team uses Git for source code management (SCM). You want to ensure that your team follows Google-recommended best practices to manage code to drive higher rates of software delivery. Which SCM process should your team use?

- A. Each developer creates a branch for their own work, commits their changes to their branch, and merges their code into the main branch after peer review.
- B. Each developer commits their code to the main branch before each product release, conducts testing, and rolls back if integration issues are detected.
- C. Each group of developers copies the repository, commits their changes to their repository, and merges their code into the main repository before each product release.
- D. Each group of developers creates a feature branch from the main branch for their work, commits their changes to their branch, and merges their code into the main branch before each major release.

**Answer: A**

### NEW QUESTION # 220

Your company's development teams want to use various open source operating systems in their Docker builds.

When images are created in published containers in your company's environment, you need to scan them for Common Vulnerabilities and Exposures (CVEs). The scanning process must not impact software development agility. You want to use managed services where possible. What should you do?

- A. Use Cloud Monitoring to review the output of Cloud Build to determine whether a vulnerable version has been used.
- B. Create a Cloud Function that is triggered on a code check-in and scan the code for CVEs.
- **C. Enable the Vulnerability scanning setting in the Container Registry.**
- D. Disallow the use of non-commercially supported base images in your development environment.

**Answer: C**

Explanation:

### NEW QUESTION # 221

You are developing an application that will store and access sensitive unstructured data objects in a Cloud Storage bucket. To comply with regulatory requirements, you need to ensure that all data objects are available for at least 7 years after their initial creation. Objects created more than

3 years ago are accessed very infrequently (less than once a year). You need to configure object storage while ensuring that storage cost is optimized. What should you do? (Choose two.)

- A. Use IAM Conditions to provide access to objects 7 years after the object creation date.
- **B. Create an object lifecycle policy on the bucket that moves objects from Standard Storage to Archive Storage after 3 years.**
- C. Implement a Cloud Function that checks the age of each object in the bucket and moves the objects older than 3 years to a second bucket with the Archive Storage class. Use Cloud Scheduler to trigger the Cloud Function on a daily schedule.
- **D. Set a retention policy on the bucket with a period of 7 years.**
- E. Enable Object Versioning to prevent objects from being accidentally deleted for 7 years after object creation.

**Answer: B,D**
