

PCEP-30-02 Real Dump, Reliable PCEP-30-02 Exam Test

What's more, part of that Itbraindumps PCEP-30-02 dumps now are free: https://drive.google.com/open?id=1dBvf-Ej7Au9_x0EbI3yt4pyqIEvvuhkG

All kinds of exams are changing with dynamic society because the requirements are changing all the time. To keep up with the newest regulations of the PCEP - Certified Entry-Level Python Programmer exam, our experts keep their eyes focusing on it. Expert team not only provides the high quality for the PCEP-30-02 Quiz guide consulting, also help users solve problems at the same time, leak fill a vacancy, and finally to deepen the user's impression, to solve the problem of PCEP-30-02 test material and no longer make the same mistake.

Python Institute PCEP-30-02 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Data Collections: In this section, the focus is on list construction, indexing, slicing, methods, and comprehensions; it covers Tuples, Dictionaries, and Strings.
Topic 2	<ul style="list-style-type: none">• Loops: while, for, range(), loops control, and nesting of loops.
Topic 3	<ul style="list-style-type: none">• parameters, arguments, and scopes. It also covers Recursion, Exception hierarchy, Exception handling, etc.
Topic 4	<ul style="list-style-type: none">• Control Flow: This section covers conditional statements such as if, if-else, if-elif, if-elif-else
Topic 5	<ul style="list-style-type: none">• Computer Programming Fundamentals: This section of the exam covers fundamental concepts such as interpreters, compilers, syntax, and semantics. It covers Python basics: keywords, instructions, indentation, comments in addition to Booleans, integers, floats, strings, and Variables, and naming conventions. Finally, it covers arithmetic, string, assignment, bitwise, Boolean, relational, and Input• output operations.

High Hit-Rate PCEP-30-02 - PCEP - Certified Entry-Level Python Programmer Real Dump

In informative level, we should be more efficient. In order to take the initiative, we need to have a strong ability to support the job search. And how to get the test PCEP-30-02 certification in a short time, which determines enough qualification certificates to test our learning ability and application level. We hope to be able to spend less time and energy to take into account the test PCEP-30-02 Certification, but the qualification examination of the learning process is very wasted energy, so how to achieve the balance? The PCEP-30-02 exam prep can be done to help you pass the PCEP-30-02 exam.

Python Institute PCEP - Certified Entry-Level Python Programmer Sample

Questions (Q10-Q15):

NEW QUESTION # 10

What is true about exceptions in Python? (Select two answers.)

- A. Python's philosophy encourages developers to make all possible efforts to protect the program from the occurrence of an exception.
- B. Not more than one except branch can be executed inside one try-except block.
- C. According to Python terminology, exceptions are raised
- D. According to Python terminology, exceptions are thrown

Answer: B,C

NEW QUESTION # 11

How many hashes (+) does the code output to the screen?

- A. three
- B. one
- C. zero (the code outputs nothing)
- D. five

Answer: D

Explanation:

The code snippet that you have sent is a loop that checks if a variable "floor" is less than or equal to 0 and prints a string accordingly. The code is as follows:

```
floor = 5
while floor > 0:
    print("+")
    floor = floor - 1
```

The code starts with assigning the value 5 to the variable "floor". Then, it enters a while loop that repeats as long as the condition "floor > 0" is true. Inside the loop, the code prints a "+" symbol to the screen, and then subtracts 1 from the value of "floor". The loop ends when "floor" becomes 0 or negative, and the code exits.

The code outputs five "+" symbols to the screen, one for each iteration of the loop. Therefore, the correct answer is C. five.

NEW QUESTION # 12

Python Is an example of which programming language category?

- A. interpreted
- B. machine
- C. assembly
- D. compiled

Answer: A

Explanation:

Explanation

Python is an interpreted programming language, which means that the source code is translated into executable code by an interpreter at runtime, rather than by a compiler beforehand. Interpreted languages are more flexible and portable than compiled languages, but they are also slower and less efficient. Assembly and machine languages are low-level languages that are directly executed by the hardware, while compiled languages are high-level languages that are translated into machine code by a compiler before execution.

NEW QUESTION # 13

What is the expected result of running the following code?

```
def do_the_mess(parameter):  
    parameter[0] -= variable  
    return parameter[0]  
  
the_list = [x for x in range(2, 3)]  
variable = 1  
do_the_mess(the_list)  
print(the_list[0])
```

- A. The code prints 1 .
- B. The code prints 0
- C. The code raises an unhandled exception.
- D. The code prints 2

Answer: C

Explanation:

Explanation

The code snippet that you have sent is trying to use the index method to find the position of a value in a list.

The code is as follows:

```
the_list = [1, 2, 3, 4, 5] print(the_list.index(6))
```

The code starts with creating a list called "the_list" that contains the numbers 1, 2, 3, 4, and 5. Then, it tries to print the result of calling the index method on the list with the argument 6. The index method is used to return the first occurrence of a value in a list. For example, the_list.index(1) returns 0, because 1 is the first value in the list.

However, the code has a problem. The problem is that the value 6 is not present in the list, so the index method cannot find it. This will cause a ValueError exception, which is an error that occurs when a function or operation receives an argument that has the right type but an inappropriate value. The code does not handle the exception, and therefore it will terminate with an error message.

The expected result of the code is an unhandled exception, because the code tries to find a value that does not exist in the list.

Therefore, the correct answer is C. The code raises an unhandled exception.

NEW QUESTION # 14

Arrange the code boxes in the correct positions in order to obtain a loop which executes its body with the level variable going through values 5, 1, and 1 (in the same order).
