## Test Drupal-Site-Builder Prep & Drupal-Site-Builder Test Duration

Drupal-Site-Builder test dumps are aiming at helping you to pass the exam in the shortest time and with the least amount of effort. As the saying goes, an inch of gold is an inch of time. Whether you are an office worker or a student or even a housewife, time is your most important resource. With Drupal-Site-Builder study materials, you may only need to spend half of your time that you will need if you don't use our Drupal-Site-Builder test answers on successfully passing a professional qualification exam. In this way, you will have more time to travel, go to parties and even prepare for another exam. The benefits of Drupal-Site-Builder Study Materials for you are far from being measured by money. Drupal-Site-Builder test answers have a first-rate team of experts, advanced learning

concepts and a complete learning model. The time saved for you is the greatest return to us.

## Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 Sample Questions (Q50-Q55):

### NEW QUESTION # 50

Your website has a content type named Hotel with a Taxonomy reference field for Landmarks vocabulary.

You want to create a view to list all the hotels filtered by landmarks as a contextual filter.

How will you pass the term name in the URL for the contextual filter?

- A. Add Landmarks vocabulary both as an exposed filter and contextual filter.
- B. Add Landmarks vocabulary as a relationship and then add Landmarks vocabulary as a contextual filter.
- C. Add Landmarks vocabulary as an exposed filter pass term name as the filter value.
- **D. Add Landmarks vocabulary as a contextual filter and pass term name as a contextual filter.**

**Answer: D**

Explanation:

In Drupal 10 and Drupal 11, Views contextual filters are used to dynamically filter content based on values passed through the URL. When filtering content by taxonomy (such as Landmarks), you configure a contextual filter using the taxonomy term field associated with the content type.

To pass a value like a term name in the URL, you must configure the contextual filter to accept term identifiers such as term ID or term name. Drupal Views allows validation and transformation of contextual input, including using the taxonomy term name via settings like "Provide default value" or "Specify validation criteria." This matches option B.

Option A is incorrect because exposed filters rely on user input via UI forms, not URL path arguments.

Option C is unnecessary duplication and not aligned with best practices. Option D is not required because taxonomy reference fields already provide the necessary relationship internally for filtering; explicitly adding a relationship is only needed in more complex multi-entity scenarios.

Therefore, the correct approach is to use a contextual filter configured to accept the taxonomy term (including term name) via the URL, making option B correct.

### NEW QUESTION # 51

You manage a popular news portal which has a very busy comments section. You've been asked to add several new fields and a View for the news area of a site. The QA team wants to review your work in staging before rolling everything out to production at once. The editorial team has specified that the site's comments activity should not be affected by these changes.

How can you meet these requirements without having to create the new functionality independently in both environments?

- **A. Create the fields and View in a development copy of the site. Export the site configuration to code. Push that code to the staging environment and import the site configuration there. Once QA is satisfied, repeat the process in production.**
- B. Copy the production database into the staging environment. Create the fields and View there. Once QA is satisfied, copy the staging database into the production environment.
- C. Create the fields and View in a fresh installation of Drupal core. Export the site configuration into your site's existing codebase, push the code to the staging environment, and import the site configuration there. Once QA is satisfied, repeat the process in production.
- D. Configuration created in the staging environment is automatically available to the production environment since they share a database.

**Answer: A**

Explanation:

Drupal's configuration management system is specifically designed to move site configuration -such as content types, fields, vocabularies, and Views-between environments by exporting configuration to files and then importing it elsewhere. Drupal documentation explicitly describes configuration as the administrative settings that determine how the site functions, and it lists fields and views as examples of configuration.

That makes option D the correct workflow: build the new fields and View on a development copy of the site, export the configuration to code, deploy that code to staging, import it for QA review, and then repeat the import in production after approval. This preserves live editorial activity such as comments, because comments are site content, not configuration, and configuration deployment avoids overwriting production content with a copied database.

Option A is risky because copying the staging database back to production could overwrite live comments and other newly created production content. Option B is false because staging and production do not automatically share configuration through one database.

in a normal deployment workflow. Option C is inferior because configuration should be created from a development copy of the actual site, where the existing modules, schema, and site setup already match the target environments.

### NEW QUESTION # 52

Your Marketing Department notified you that the company has recently obtained a new Toll-free phone number for customer care. They have asked you to update the "Customer care contact information" posted on your website with the new number. The contact information appears in the sidebar of every page on the site.

How should you make your updates? (Select 2 options)

- A. Click the "Manage layout" link of the home page, find the field containing the inaccurate information, and make changes there.
- B. Navigate to the Block Layout admin page's custom block library, find the custom block that contains the information in question, and make changes to the content in the block editor.
- C. Hover over the content until a pencil icon appears, click the icon, and choose "Edit" so that you can modify the content in Custom block edit interface.
- D. Click the "Edit" link on any page and make changes to the content in the editor form; repeat this process for all pages on the site.

**Answer: B,C**

Explanation:

In Drupal 10 and Drupal 11, content that appears in the sidebar across all pages is typically implemented as a custom block placed in a theme region via the Block Layout system. Drupal documentation explains that reusable content like contact information is best managed through custom blocks, which can be edited centrally and automatically update everywhere they are placed.

Option A is correct because the proper way to update such content is to go to Structure # Block layout # Custom block library, locate the block, and edit it. This ensures the change is reflected globally wherever the block is used.

Option C is also correct because Drupal provides contextual links (the pencil icon) that allow administrators to directly edit blocks from the front end. This is a standard and documented shortcut for editing block content.

Option B is incorrect because Layout Builder is not mentioned and is not required here. Option D is incorrect because editing individual pages would not update a shared sidebar block and would be inefficient and incorrect.

Thus, the correct Drupal site-building approaches are editing the custom block via the block library or using contextual links, making A and C correct.

### NEW QUESTION # 53

Users are complaining that listing pages with a large number of images are loading very slowly. On reviewing this you found that full-sized images are loaded while displaying thumbnails.

How will you ensure that smaller sized images are used as thumbnails?

- A. Enable the "Optimize images" option on the Performance administration page.
- B. Use CSS to resize the images.
- C. Use an image style to resize the images.
- D. Use JavaScript to resize the images.

**Answer: C**

Explanation:

In Drupal 10 and Drupal 11, the correct way to display resized images (such as thumbnails) is by using Image Styles. Image styles allow Drupal to generate derivative images with specific dimensions (e.g., thumbnail size) and serve those instead of the original full-sized image. This significantly improves performance because smaller image files are loaded, reducing page load time and bandwidth usage.

Drupal's Image module documentation explains that image styles can apply effects such as scaling, cropping, and resizing, and are typically used in Views or field display settings to ensure appropriately sized images are rendered.

Options C and D (JavaScript and CSS resizing) only change how images appear visually but still load the full-size image, which does not improve performance. Option A refers to performance settings but does not specifically handle image resizing.

Therefore, using an image style is the correct, recommended, and documented approach for optimizing image display and improving site performance.

### NEW QUESTION # 54

An audit of a corporate Drupal website revealed that a lot of user accounts are being created on the site, with the status "blocked". The site was initially set up to allow editors to self-register with additional administrator approval. However, the audit revealed that robots are creating a lot of user accounts and administrators are not able to keep up with the approval process. How can we eliminate fake user registration?

- A. Configure new user accounts to "require email verification when a visitor creates an account."
- B. Hide user login by disabling the login block and/or move the login page.
- **C. Enable the Drupal core captcha field on the user registration form.**
- D. Change who can register accounts to "Administrators only."

**Answer: C**

Explanation:

The most effective and Drupal-recommended way to prevent automated (bot-driven) user registrations is to implement a challenge-response mechanism such as CAPTCHA. In Drupal 10 and Drupal 11, this is achieved using the CAPTCHA module (often paired with reCAPTCHA), which integrates directly into forms like user registration. By enabling a CAPTCHA field on the registration form, bots are prevented from submitting automated requests because they cannot solve the challenge, while legitimate users can proceed normally.

Drupal's security best practices emphasize mitigating automated abuse at the form level rather than relying solely on post-registration controls. Option A (email verification) still allows bots to create accounts and flood the system, even if they cannot activate them. Option C (hiding login) does not affect registration endpoints and provides no real protection. Option D (restricting registration to administrators only) eliminates self-registration entirely, which may not meet business requirements and is not a balanced solution. Therefore, enabling CAPTCHA directly addresses the root cause-automated submissions-making it the most appropriate and scalable solution according to Drupal security guidelines.

### NEW QUESTION # 55

.....

As we all know, if everyone keeps doing one thing for a long time, as time goes on, people's attention will go from rising to falling. Experiments have shown that this is scientifically based and that our attention can only play the best role in a single period of time. In reaction to the phenomenon, therefore, the Drupal-Site-Builder test material is reasonable arrangement each time the user study time, as far as possible let users avoid using our latest Drupal-Site-Builder Exam Torrent for a long period of time, it can better let the user attention relatively concentrated time efficient learning. The Drupal-Site-Builder practice materials in every time users need to master the knowledge, as long as the user can complete the learning task in this period, the Drupal-Site-Builder test material will automatically quit learning system, to alert users to take a break, get ready for the next period of study.
