2026 Latest ExamsLabs Professional-Cloud-Architect PDF Dumps and Professional-Cloud-Architect Exam Engine Free Share: <https://drive.google.com/open?id=13xPpQ1m45HndIrsQid3AbsLiGTxnhra>

Whole ExamsLabs's pertinence exercises about Google certification Professional-Cloud-Architect exam is very popular. ExamsLabs's training materials can not only let you obtain IT expertise knowledge and a lot of related experience, but also make you be well prepared for the exam. Although Google Certification Professional-Cloud-Architect Exam is difficult, through doing ExamsLabs's exercises you will be very confident for the exam. Be assured to choose ExamsLabs efficient exercises right now, and you will do a full preparation for Google certification Professional-Cloud-Architect exam.

ExamsLabs Professional-Cloud-Architect exam dumps have been designed with the best possible format, ensuring all necessary information packed in them. Our experts have used only the authentic and recommended sources of studies by the certifications vendors for exam preparation. The information in the Professional-Cloud-Architect Brain Dumps has been made simple up to the level of even an average exam candidate. To ease you in your preparation, each Professional-Cloud-Architect dumps are made into easy English so that you learn information without any difficulty to understand them.

Test Professional-Cloud-Architect Topics Pdf, Vce Professional-Cloud-

Architect Exam

The Professional-Cloud-Architect Mock Exams not just give you a chance to self-access before you actually sit for the certification exam, but also help you get an idea of the Google exam structure. It is well known that students who do a mock version of an exam benefit from it immensely. Some Google certified experts even say that it can be a more beneficial way to prepare for the Google Certified Professional - Cloud Architect (GCP) exam than spending the same amount of time studying.

Google Certified Professional - Cloud Architect (GCP) Sample Questions (Q30-Q35):

NEW QUESTION # 30

Your company is designing its data lake on Google Cloud and wants to develop different ingestion pipelines to collect unstructured data from different sources. After the data is stored in Google Cloud, it will be processed in several data pipelines to build a recommendation engine for end users on the website. The structure of the data retrieved from the source systems can change at any time. The data must be stored exactly as it was retrieved for reprocessing purposes in case the data structure is incompatible with the current processing pipelines. You need to design an architecture to support the use case after you retrieve the data. What should you do?

- A. Send the data through the processing pipeline, and then store the processed data in a BigQuery table for reprocessing.
- B. Store the data in a BigQuery table. Design the processing pipelines to retrieve the data from the table.
- C. Send the data through the processing pipeline, and then store the processed data in a Cloud Storage bucket for reprocessing.
- **D. Store the data in a Cloud Storage bucket. Design the processing pipelines to retrieve the data from the bucket**

Answer: D

Explanation:

Topic 1, EHR Health Care

Company Overview

EHR Healthcare is a leading provider of electronic health record software to the medical industry. EHR Healthcare provides their software as a service to multi-national medical offices, hospitals, and insurance providers.

Solution concept

Due to rapid changes in the healthcare and insurance industry, EHR Healthcare's business has been growing exponentially year over year. They need to be able to scale their environment, adapt their disaster recovery plan, and roll out new continuous deployment capabilities to update their software at a fast pace. Google Cloud has been chosen to replace their current colocation facilities.

Existing technical environment

EHR's software is currently hosted in multiple colocation facilities. The lease on one of the data centers is about to expire.

Customer-facing applications are web-based, and many have recently been containerized to run on a group of Kubernetes clusters.

Data is stored in a mixture of relational and NoSQL databases (MySQL, MS SQL Server, Redis, and MongoDB).

EHR is hosting several legacy file- and API-based integrations with insurance providers on-premises. These systems are scheduled to be replaced over the next several years. There is no plan to upgrade or move these systems at the current time.

Users are managed via Microsoft Active Directory. Monitoring is currently being done via various open source tools. Alerts are sent via email and are often ignored.

Business Requirements

- * On-board new insurance providers as quickly as possible.
- * Provide a minimum 99.9% availability for all customer-facing systems.
- * Provide centralized visibility and proactive action on system performance and usage.
- * Increase ability to provide insights into healthcare trends.
- * Reduce latency to all customers.
- * Maintain regulatory compliance.
- * Decrease infrastructure administration costs.
- * Make predictions and generate reports on industry trends based on provider data.

Technical Requirements

- * Maintain legacy interfaces to insurance providers with connectivity to both on-premises systems and cloud providers.
- * Provide a consistent way to manage customer-facing applications that are container-based.
- * Provide a secure and high-performance connection between on-premises systems and Google Cloud.
- * Provide consistent logging, log retention, monitoring, and alerting capabilities.
- * Maintain and manage multiple container-based environments.
- * Dynamically scale and provision new environments.
- * Create interfaces to ingest and process data from new providers.

Executive statement

Our on-premises strategy has worked for years but has required a major investment of time and money in training our team on distinctly different systems, managing similar but separate environments, and responding to outages. Many of these outages have been a result of misconfigured systems, inadequate capacity to manage spikes in traffic, and inconsistent monitoring practices. We want to use Google Cloud to leverage a scalable, resilient platform that can span multiple environments seamlessly and provide a consistent and stable user experience that positions us for future growth.

NEW QUESTION # 31

You are deploying an application on App Engine that needs to integrate with an on-premises database. For security purposes, your on-premises database must not be accessible through the public Internet. What should you do?

- A. Deploy your application on App Engine standard environment and use App Engine firewall rules to limit access to the open on-premises database.
- B. Deploy your application on App Engine flexible environment and use App Engine firewall rules to limit access to the on-premises database.
- C. Deploy your application on App Engine flexible environment and use Cloud VPN to limit access to the on-premises database.
- D. Deploy your application on App Engine standard environment and use Cloud VPN to limit access to the on-premises database.

Answer: C

Explanation:

Reference:

<https://cloud.google.com/appengine/docs/flexible/python/using-third-party-databases>

NEW QUESTION # 32

Your organization requires that metrics from all applications be retained for 5 years for future analysis in possible legal proceedings. Which approach should you use?

- A. Grant the security team access to the logs in each Project.
- B. Configure Stackdriver Monitoring for all Projects with the default retention policies.
- C. Configure Stackdriver Monitoring for all Projects, and export to Google Cloud Storage.
- D. Configure Stackdriver Monitoring for all Projects, and export to BigQuery.

Answer: C

Explanation:

<https://cloud.google.com/monitoring/api/v3/metrics>

NEW QUESTION # 33

One of your primary business objectives is being able to trust the data stored in your application. You want to log all changes to the application data. How can you design your logging system to verify authenticity of your logs?

- A. Use a SQL database and limit who can modify the log table.
- B. Create a JSON dump of each log entry and store it in Google Cloud Storage.
- C. Write the log concurrently in the cloud and on premises.
- D. Digitally sign each timestamp and log entry and store the signature.

Answer: B

Explanation:

<https://cloud.google.com/storage/docs/access-logs>

NEW QUESTION # 34

Your company is running its application workloads on Compute Engine. The applications have been deployed in production,

acceptance, and development environments. The production environment is business-critical and is used 24/7, while the acceptance and development environments are only critical during office hours. Your CFO has asked you to optimize these environments to achieve cost savings during idle times. What should you do?

- A. Create a shell script that uses the `gcloud` command to change the machine type of the development and acceptance instances to a smaller machine type outside of office hours. Schedule the shell script on one of the production instances to automate the task.
- B. Deploy the development and acceptance applications on a managed instance group and enable autoscaling.
- C. Use regular Compute Engine instances for the production environment, and use preemptible VMs for the acceptance and development environments.
- **D. Use Cloud Scheduler to trigger a Cloud Function that will stop the development and acceptance environments after office hours and start them just before office hours.**

Answer: D

Explanation:
