Test SCA-C01 Simulator Free & SCA-C01 Reliable Exam Testking

It is seen as a challenging task to pass the SCA-C01 exam. Tests like these demand profound knowledge. The Tableau SCA-C01 certification is absolute proof of your talent and ticket to high-paying jobs in a renowned firm. Tableau SCA-C01 test every year to

shortlist applicants who are eligible for the SCA-C01 exam certificate.

Tableau Server Certified Associate Exam Sample Questions (Q188-Q193):

NEW QUESTION # 188

True or False:

Before you add URL parameters, you have to add :iid=[#] at the end of the URL, since this creates a view counter for your current browser session

- A. FALSE
- B. TRUE

Answer: A

Explanation:

Explanation

https://help.tableau.com/current/pro/desktop/en-us/embed_structure.htm#adding-parameters-to-the-base-url

NEW QUESTION # 189

What type of information is stored in the tsm maintenance backup -f<filename>.tsbak command?

- A. Notification settings
- B. Topology data
- C. SMTP server settings
- D. Repository data

Answer: D

Explanation:

The tsm maintenance backup command creates a backup file (with a .tsbak extension) that captures critical data needed to restore Tableau Server in case of failure or migration. This backup primarily includes:

Repository data: This encompasses the PostgreSQL database, which stores metadata such as workbooks, data sources, user information, permissions, schedules, and subscriptions.

Configuration data: This includes server settings like authentication methods, port configurations, and service layouts, but it does not include topology data as a separate entity (topology is part of the configuration).

The command does not back up the following:

Extract files (stored in the File Store), which must be backed up separately if needed.

Log files, which are archived using tsm maintenance ziplogs.

Option A (Notification settings) is incorrect because while notification settings are part of the configuration data stored in the repository, they are not the primary focus of the backup. The broader category is "repository data." Option B (SMTP server settings) is also incorrect for the same reason-SMTP settings are configuration data within the repository, but the backup is not limited to just these settings.

Option D (Topology data) is incorrect because topology data (e.g., how services are distributed across nodes) is part of the configuration included in the backup, but it's not stored as a standalone item. The .tsbak file is centered on the repository database.

NEW QUESTION # 190

What account should you use to run the Tableau Server installation program?

- A. A local user account
- B. An account in the local administrator group
- C. A domain user account
- D. An NT AUTHORITY\NetworkService account

Answer: B

Explanation:

Installing Tableau Server on Windows requires an account with sufficient privileges to configure services, write to the file system, and manage registry settings. Let's analyze this in depth:

- * Installation Requirements:
- * The installer creates services (e.g., Tableau Server Gateway), writes to Program Files and ProgramData, and configures TSM.
- * It needs local administrative privileges on the machine to perform these tasks.
- * Post-install, a "Run As" account can be set for services (e.g., NT AUTHORITY\NetworkService), but this is separate from the install account.
- * Option C (An account in the local administrators group): Correct.
- * Why: The account must be in the local Administrators group to:
- * Install software (UAC elevation).
- * Configure services and ports.
- * Write to protected directories (e.g., C:\Program Files\Tableau).
- * Examples: A local admin (e.g., Administrator) or a domain user added to the Administrators group (e.g., DOMAIN\AdminUser).
- * Process: Log in as this account, run the installer, and provide TSM admin credentials during setup.
- * Option A (A local user account): Incorrect.
- * A standard local user (not in Administrators) lacks permissions-installation would fail with "Access Denied" errors.
- * Option B (A domain user account): Incorrect unless clarified.
- * A domain user without local admin rights can't install. If it's in the Administrators group, it qualifies, but C is more specific.
- * Option D (NT AUTHORITY\NetworkService): Incorrect.
- * This is a built-in service account for running services (default "Run As" post-install), not for executing the installer-an interactive user account is required.

Why This Matters: Using the right account prevents install failures and ensures secure configuration- critical for production setups.

NEW QUESTION # 191

You have an existing group subscription. You add a user to the group. What statement correctly describes the result?

- A. The subscription will continue to include only the members of the group at the time the subscription was made
- **B. The subscription updates automatically to include the new user**
- C. The administrator receives a notice to approve or deny adding the user to the subscription
- D. The creator of the subscription receives notice of the change and must manually edit the subscription to reflect the new group membership

Answer: B

Explanation:

Subscriptions in Tableau Server deliver workbook views to users via email on a schedule. Group subscriptions apply to all group members-let's unpack this:

- * Group Subscription Mechanics:
- * Created via Workbooks > Actions > Subscribe > Select Group.
- * Delivers content to all users in the group at the time the subscription runs (e.g., daily PDF).
- * Dynamic: Membership updates (additions/removals) are reflected automatically on the next run.
- * Option C (The subscription updates automatically to include the new user): Correct.
- * Details: When you add a user to the group (e.g., via Users > Groups > Add Users), Tableau Server's subscription process queries the group's current membership at runtime. The new user receives the subscription on the next scheduled delivery-no manual action needed.
- * Example: Group "Sales" has a 9 AM subscription. Add a user at 8 AM-they get the email tomorrow at 9 AM.
- * Option A (Admin receives notice to approve/deny): Incorrect.
- * Why: No approval workflow exists for group membership changes in subscriptions-it's automatic.
- * Option B (Creator must manually edit): Incorrect.
- * Why: Subscriptions are tied to the group, not a static user list-manual edits aren't required for membership changes.
- * Option D (Only members at creation time): Incorrect.
- * Why: This would be true for individual subscriptions (static list), but group subscriptions are dynamic.

Why This Matters: Dynamic group subscriptions streamline content delivery as teams evolve, reducing admin overhead.

NEW QUESTION # 192

Backward Compatibility Scenario (True or False):

- * Suppose Linus publishes a workbook from Tableau Desktop 2018.2 to Tableau Server 2020.1
- * Steph downloads the workbook from Tableau Server to Tableau Desktop 2020.1 - she does some edits and republishes the workbook back to the server

* Charles and Raina, who are both using Tableau Desktop 2018.2, can download the workbook, but cannot open the workbook

- A. FALSE
- B. TRUE

Answer: B

Explanation:

Explanation
