Cisco 800-150 考試大綱：

主題	簡介
主題 1	Common Service Tasks and Tools: This section of the exam measures the skills of a Technical Support Engineer and focuses on tasks commonly needed to manage Cisco devices. It explains how devices boot up, introduces common Cisco IOS commands, and identifies tools for file management. It shows how to confirm physical connections, remotely access devices, and connect to the console port. It also covers how to capture the status of a device, recover passwords, and replace devices by using proper tools. Students are also taught how to find serial numbers on Cisco equipment to assist with support and maintenance activities.
主題 2	Cisco Software: This section of the exam measures the skills of a Network Engineer and discusses Cisco's software systems and licensing. It explains the difference between IOS install and bundle modes and gives an overview of different licensing models. Students learn how to manage Cisco software images, including backing up, transferring, and installing images via FTP, TFTP, or USB. It also covers how to handle configuration files to keep devices running properly and ensure smooth upgrades or replacements.

主題 3	• Cisco Hardware Replacement: This section of the exam measures the skills of a Technical Support Engineer and teaches how to safely and correctly replace Cisco hardware. It explains safety procedures such as creating safe work zones and handling electrostatic discharge. Students learn the step-by-step processes to replace a wide range of Cisco devices, from switches and routers to firewalls, UCS servers, and collaboration endpoints. It also covers configuring Cisco NX-OS software, including understanding operating modes, boot procedures, and password recovery, and introduces Cisco collaboration endpoint solutions like IP phones and video systems.

問題 #22

Which common CLI command is used to install Cisco NX-OS Software?

- A. install all
- B. boot system
- C. install kickstart
- D. copy tftp: running-config

答案: A

解題說明:

The `install all` command is the standard method used to install or upgrade Cisco NX-OS software on Nexus switches. This command streamlines the installation process by automating tasks such as verifying the software image, checking for compatibility, and managing the installation of optional packages or SMUs (Software Maintenance Upgrades). It ensures a comprehensive and efficient upgrade process, minimizing the potential for errors.

In contrast:

* `copy tftp: running-configs` is used to copy configuration files, not software images.

* `install kickstart` is an outdated command from earlier NX-OS versions.

* `boot system` sets the boot variable but does not handle the full installation process.

問題 #24

Which scenario would result in a speed mismatch when configuring Ethernet devices with different speed settings?

- A. Both ends are set to auto-negotiation and fail, reverting to their lowest speeds
- B. One end is manually set to 1 Gbps, and the other end is manually set to 100 Mbps
- C. One end is manually set to 100 Mbps, and the other end is set to auto-negotiation
- D. Both ends are manually set to the same speed

答案: B

解題說明：

A speed mismatch occurs when two connected Ethernet devices are configured to operate at different speeds.

In scenario A, one device is manually set to 1 Gbps, while the other is set to 100 Mbps. Since both ends are hard-coded to different speeds, they cannot successfully negotiate a common speed, leading to a mismatch and resulting in a failed or unstable link.

In contrast, scenario B, where both ends are manually set to the same speed, ensures compatibility and stable communication.

Scenario C can lead to a duplex mismatch rather than a speed mismatch; the auto-negotiating end may default to half-duplex if it cannot determine the duplex setting of the manually configured end.

Scenario D is less common; if auto-negotiation fails, devices may revert to their lowest common speed, but this typically results in reduced performance rather than a complete mismatch.

問題 #25

Refer to the exhibit.

Refer to the exhibit. Which component is highlighted on the Cisco I/O module image?

- A. captive screw
- B. chassis connections LED
- C. fan module LED
- D. fixed port

答案： B

解題說明：

The highlighted component on the Cisco I/O module is the chassis connections LED, which indicates the status of connectivity between the I/O module and the chassis.

In the exhibit, the orange arrow points to a small rectangular LED indicator located to the left side of the I/O module (Cisco UCS-IOM-2304). This specific LED is not aligned with the ports, fans, or screws, which helps identify it correctly.

Chassis connections LED (B) is responsible for indicating the status of uplink/downlink communication between the I/O module and the chassis.

Green usually indicates a healthy link.

Amber or off may indicate a problem or no connection.

Why the other answers are incorrect:

A. Captive screw → These are at the far corners, not where the arrow points.

C. Fan module LED → This IOM doesn't have user-visible fan LEDs at the front face.

D. Fixed port → These are the large rectangular SFP ports clearly visible in the middle, not near the arrow.

This identification is important when troubleshooting chassis-to-IOM connectivity or verifying module status LEDs during field maintenance.
