## CCRN Pediatric Practice Exam Questions from AACN

To promote effective grieving in a 6-year-old sibling following the death of an infant, the nurse should:

- A) Recommend that the sibling not attend the infant's memorial service
  - B) Encourage the parents to minimize their expression of grief with the sibling
  - C) Explain to the sibling that the infant went to heaven
  - D) Explain to the sibling that thoughts and wishes did not cause the infant's death - Ans Answer: D) Explain to the sibling that thoughts and wishes did not cause the infant's death: At age 6, children may take words literally and because of their egocentrism, they believe that thoughts are all-powerful. They may truly believe they caused the death of their sibling. A simple, honest explanation of why the sibling died is indicated. This intervention is consistent with Caring Processes.
- A) Recommend that the sibling not attend the infant's memorial service: This intervention is not a solution to the problem and will not promote effective grieving for the sibling. It is not consistent with Caring Processes.
- B) Encourage the parents to minimize their expression of grief with the sibling: This intervention will lead to ineffective grieving for the sibling and is not consistent with Caring Processes.
- C) Explain to the sibling that the infant went to heaven: This intervention will not address the sibling's problem.

A 5-year-old with a history of congenital hydrocephalus and VP shunt placement at four weeks of age is admitted with increased somnolence, decreased appetite, and increased complaints of headache. This morning the child vomited twice. The nurse should anticipate:

- A) The physician ordering lumbar puncture and blood and urine cultures
  - B) the patient having a CT scan followed by possible shunt revision
  - C) Administering mannitol or hypertonic saline
  - D) Administering phenytoin (Dilantin) or fosphenytoin (Cerebyx) - Ans Answer: B) The patient having a CT scan followed by possible shunt revision: This patient is demonstrating signs of increased intracranial pressure. The most likely etiology is malfunction of the VP shunt as a result of blockage or disconnection, which is particularly likely over time as the child grows. The definitive diagnosis is made by a CT scan and a shunt series. Surgical intervention for a shunt revision would be indicated.
- A) The physician ordering lumbar puncture and blood and urine cultures: These interventions will not address the most likely primary problem, which is suspected VP shunt malfunction. Additionally, lumbar puncture is contraindicated in the presence of increased intracranial pressure, because downward herniation of the brainstem can occur.
- C) Administering mannitol or hypertonic saline: These medication are indicated for the medical management of increased intracranial pressure, of which this patient has

Itexamguide offers a full refund guarantee according to terms and conditions if you are not satisfied with our CCRN-Pediatric product. You can also get free AACN Dumps updates from Itexamguide within up to 365 days of purchase. This is a great offer because it helps you prepare with the Latest CCRN-Pediatric Dumps even in case of real Critical Care Nursing Exam (CCRN-Pediatric) exam changes.

Graduated nurses and other pediatric nurses seeking employment in pediatric critical care should consider the AACN CCRN-Pediatric Exam's importance in their career development. CCRN-Pediatric exam provides a higher level of confidence to employers and recruiters that they are hiring individuals with the required knowledge, skills, and abilities to succeed in the Pediatric Critical Care setting. Furthermore, it can improve their earnings and job prospects in the critical care specialty of an increasingly complex healthcare environment.

AACN CCRN-Pediatric Certification Exam covers a wide range of topics related to the care of acutely ill pediatric patients such as cardiovascular, neurological, respiratory, endocrine, gastrointestinal, renal, and immune system dysfunctions. CCRN-Pediatric exam also tests a nurse's knowledge of pharmacological interventions and procedures used in the critical care setting. CCRN-Pediatric exam consists of 125 multiple-choice questions and is administered via computer-based testing at designated testing centers throughout the United States.

## Enhance Your Preparation with the AACN CCRN-Pediatric Online Practice Test Engine

In the era of information explosion, people are more longing for knowledge, which bring up people with ability by changing their thirst for knowledge into initiative and "want me to learn" into "I want to learn". As a result thousands of people put a premium on obtaining CCRN-Pediatric certifications to prove their ability. With the difficulties and inconveniences existing for many groups of people like white-collar worker, getting a CCRN-Pediatric Certification may be draining. Therefore, choosing a proper CCRN-Pediatric study materials can pave the path for you which is also conducive to gain the certification efficiently.

### AACN Critical Care Nursing Exam Sample Questions (Q93-Q98):

#### NEW QUESTION # 93

A nurse is caring for a toddler with atopic dermatitis. The nurse should instruct the mother to:

- A. wrap the baby's hands in mittens or socks to prevent scratching
- B. clean the affected areas with tepid water and detergent
- C. keep the baby away from other children while rashes are present.
- D. dress the child warmly to avoid chilling

**Answer: A**

Explanation:

Explanation: A child with atopic dermatitis needs to have short fingernails and covered so the child will not be able to scratch the lesions, thereby causing new lesions and possible a secondary infection.

#### NEW QUESTION # 94

Which of the following is a prerenal cause of acute renal failure?

- A. Septic shock
- B. Transfusion reaction
- C. Lead poisoning
- D. Kidney stones

**Answer: A**

Explanation:

Prerenal failure is caused by conditions that impair renal perfusion without direct injury to the kidneys themselves. Septic shock leads to systemic vasodilation, hypotension, and decreased renal perfusion, making it a classic prerenal etiology.

"Prerenal causes of acute kidney injury (AKI) include any condition resulting in reduced renal blood flow.

Septic shock is a common prerenal cause, where hypoperfusion leads to decreased glomerular filtration." (Referenced from CCRN Pediatric - Direct Care: Renal Dysfunction and Fluid Balance)

#### NEW QUESTION # 95

When assessing the fluid and electrolyte balance in an infant, which of the following would be important to remember:

- A. Infants have more intracellular water than adults do
- B. The metabolic rate of an infant is slower than in adults
- C. Infant has greater body surface area than adults
- D. Infant can concentrate urine at an adult level

**Answer: C**

Explanation:

Explanation: Infants have greater body surface area than adults, increasing their risk to F&E imbalances.

Also infants can't concentrate a urine at an adult level and their metabolic rate, also called water turnover, is 2 to 3 times higher than

adult. Plus more fluids of the infants are at the ECF spaces not in the ICF spaces.

#### NEW QUESTION # 96

Family members have been complaining about limited visiting hours. To facilitate a potential change in practice, a nurse should first:

- A. **Begin a literature search on family visitation practices**
- B. Draft a new policy regarding visitation practices for the unit
- C. Consult with medical staff to change visiting hours
- D. Schedule an interdisciplinary team meeting to discuss visiting hours

**Answer: A**

Explanation:

Before initiating policy changes, the nurse must conduct an evidence-based literature review to assess the benefits and risks associated with altering visitation policies. This aligns with professional nursing standards that promote evidence-informed practice and family-centered care.

"In professional practice, initiating a literature review is the first step in evidence-based change. This supports the rationale for modifying clinical practices and promotes interdisciplinary consensus." (Referenced from CCRN Pediatric - Professional Caring and Ethical Practice: Evidence-Based Practice and Family-Centered Care)

#### NEW QUESTION # 97

A teenage patient has an abrasion on her right forearm after a fall from a bicycle 3 days ago. The arm is cool, pale, and tight, capillary refill is greater than 5 seconds, and movement of her fingers is limited.

Which of the following should a nurse anticipate as the initial treatment?

- A. Fluid bolus and antibiotic administration
- B. **Incisional fasciotomy**
- C. Application of an immobilizing device
- D. X-ray of the right forearm

**Answer: B**

Explanation:

This clinical picture is classic for compartment syndrome: a surgical emergency. Symptoms include cool extremity, prolonged capillary refill, pain, paresthesia, and loss of motor function. Fasciotomy is the definitive treatment to relieve pressure and prevent permanent damage.

"Compartment syndrome requires immediate fasciotomy. Delay in intervention may lead to muscle necrosis and permanent disability." (Referenced from CCRN Pediatric - Direct Care: Musculoskeletal, Orthopedic Trauma and Emergencies)

#### NEW QUESTION # 98

.....

In modern society, whether to obtain CCRN-Pediatric certification has become a standard to test the level of personal knowledge. Many well-known companies require the CCRN-Pediatric certification at the time of recruitment.
