800-150 Certification Exam & Valid 800-150 Test Cost

You will feel convenient if you buy our product not only because our 800-150 exam prep is of high pass rate but also our service is also perfect. What's more, our update can provide the latest and most useful 800-150 exam guide to you, in order to help you learn more and master more. We provide great customer service before and after the sale and different versions for you to choose, you can download our free demo to check the quality of our 800-150 Guide Torrent before you make your purchase. You will never be disappointed for buying our 800-150 exam questions.

Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q47-Q52):

NEW QUESTION # 47

What must be verified before installing or replacing DIMMs in a Cisco UCS server?

- A. Exact type, speed, and capacity of the DIMM
- **B. Current DIMM configuration and population order**
- C. Maximum supported DIMM capacity for the server model
- D. Compatibility of the DIMM with the current firmware version of the server

Answer: B

Explanation:

Before installing or replacing DIMMs (Dual In-line Memory Modules) in a Cisco UCS server, it is essential to verify the current

DIMM configuration and the population order. Cisco UCS servers have strict memory population rules to ensure optimal performance and compatibility, particularly in relation to memory channels and banks.

While the type, capacity, and firmware compatibility are important, failing to follow the correct population guidelines can result in failed boot processes or suboptimal performance.

NEW QUESTION # 48

Drag and drop the steps from the left into order to capture the status of a Cisco device.

□

Answer:

Explanation:

□

NEW QUESTION # 49

What is the primary purpose of backing up the endpoint configuration prior to replacing the device?

- A. To update the firmware of the device
- B. To generate a performance report for the old device
- C. To troubleshoot network connectivity issues
- **D. Torestore settings on the new device after replacement**

Answer: D

Explanation:

Backing up the configuration of a network device before replacement is a critical step to ensure business continuity and minimize downtime. The primary purpose of this backup is to restore the existing settings onto the new device, ensuring that it operates identically to the one being replaced.

This process includes preserving interface configurations, routing protocols, access control lists, and other essential parameters. By restoring the backed-up configuration to the new device, network administrators can quickly reintegrate it into the network infrastructure without the need for manual reconfiguration, thereby reducing the risk of errors and service disruptions.

Options A, B, and C do not align with the primary objective of configuration backups in the context of device replacement.

NEW QUESTION # 50

Which step must be performed immediately after powering off the device when replacing a Cisco chassis?

- A. Remove the chassis ground.
- B. Remove the chassis.
- C. Back up the device configuration.
- **D. Label and remove all I/O cables.**

Answer: D

Explanation:

After powering off a Cisco device in preparation for chassis replacement, the immediate next step is to label and remove all I/O cables. This step is crucial to ensure that all connections can be accurately restored after the new chassis is installed.

Proper labeling prevents confusion and potential misconfigurations during reassembly. Only after all cables are safely disconnected should you proceed to remove the chassis ground and then the chassis itself.

NEW QUESTION # 51

Which command is used to download a copied configuration file from a TFTP server to merge it with the running configuration of a replacement Cisco device?

- A. load tftp: running-config
- **B. copy tftp: running-config**

- C. copy tftp: startup-config
- D. merge tftp: running-config

Answer: B

Explanation:

The command `copy tftp: running-config` is used to retrieve a configuration file from a TFTP server and merge it with the current running configuration of a Cisco device. This operation is additive, meaning it integrates the new configuration commands into the existing running configuration without removing any pre-existing commands unless explicitly overridden.

This method is particularly useful when restoring configurations to a replacement device, as it allows for the seamless integration of necessary settings without disrupting the current operational state.

In contrast, using `copy tftp: startup-config` would overwrite the startup configuration file, which could lead to unintended consequences upon the next device reload. The options `load tftp: running-config` and `merge tftp:`

`running-config` are not valid Cisco IOS commands.
