Pass Guaranteed 2026 Newest Nutanix Reliable NCP-US-6.5 Exam Voucher

You can hardly grow by relying on your own closed doors. So you have to study more and get a certification to prove your strenght. And our NCP-US-6.5 preparation materials are very willing to accompany you through this difficult journey. You know, choosing a good product can save you a lot of time. For at least, you have to find the reliable exam questions such as our NCP-US-6.5 Practice Guide. And our NCP-US-6.5 preparation questions can help you not only learn the most related information on the subject, but also get the certification with 100% success guarantee.

Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 Sample Questions (Q97-Q102):

NEW QUESTION # 97

Which user is authorized to deploy File Analytics?

- A. AD user mapped to a Prism admin role
- B. Prism Element administrator
- C. AD user mapped to a Cluster admin role
- **D. Prism Central administrator**

Answer: D

Explanation:

The user that is authorized to deploy File Analytics is Prism Central administrator. Prism Central is a web-based user interface that allows administrators to manage multiple Nutanix clusters and services, including Files and File Analytics. Prism Central administrator is a user role that has full access and control over all Prism Central features and functions. To deploy File Analytics, the user must log in to Prism Central as a Prism Central administrator and follow the steps in the File Analytics Deployment wizard. References: Nutanix Files Administration Guide, page 93; Nutanix File Analytics Deployment Guide

NEW QUESTION # 98

Users are complaining about having to reconnect to a share when there are networking issues. Which Files feature should the administrator enable to ensure the sessions will auto-reconnect in such events?

- A. Connected Shares
- **B. Durable File Handles**
- C. Workload Optimization
- D. Multi-Protocol Shares

Answer: B

Explanation:

Nutanix Files, part of Nutanix Unified Storage (NUS), provides file sharing services via protocols like SMB and NFS. In environments where users access SMB shares, network interruptions can cause sessions to disconnect, requiring users to manually reconnect. Nutanix Files offers a feature to mitigate this issue for SMB shares.

Analysis of Options:

* Option A (Durable File Handles): Correct. Durable File Handles is an SMB feature in Nutanix Files that allows client sessions to automatically reconnect after temporary network interruptions. When enabled, it ensures that file handles remain valid during brief disconnects, allowing the client to resume the session without manual intervention.

* Option B (Multi-Protocol Shares): Incorrect. Multi-Protocol Shares allow a share to be accessed via both SMB and NFS, but this feature does not address session reconnection during network issues.

* Option C (Connected Shares): Incorrect. "Connected Shares" is not a feature in Nutanix Files. This appears to be a made-up term and does not apply to session reconnection.

* Option D (Workload Optimization): Incorrect. Workload Optimization in Nutanix Files involves adjusting the number of FSVMs or resources for performance (as noted in Question 13), but it does not address session reconnection for network issues.

Why Durable File Handles?

Durable File Handles is an SMB 2.1+ feature supported by Nutanix Files. It ensures that file handles persist during network disruptions, allowing clients to auto-reconnect without losing their session state, which directly addresses the users' complaint.

Exact Extract from Nutanix Documentation:

From the Nutanix Files Administration Guide (available on the Nutanix Portal):

"Durable File Handles is an SMB feature that allows clients to automatically reconnect to a share after temporary network interruptions. When enabled on a Nutanix Files share, it ensures that file handles remain valid, preventing users from having to manually reconnect during brief network outages."

NEW QUESTION # 99

An administrator is having difficulty enabling Data Lens for a file server. What is the most likely cause of this issue?

- A. SSR is enabled on the file server.
- **B. The file server has been cloned.**
- C. The file server is in a Protection Domain.
- D. The file server has blacklisted file types.

Answer: B

Explanation:

Nutanix Data Lens, a service integrated with Nutanix Unified Storage (NUS), provides data governance, analytics, and ransomware protection for Nutanix Files. Enabling Data Lens for a file server involves configuring the service to monitor the file server's shares. If

the administrator is unable to enable Data Lens, there may be a configuration or compatibility issue with the file server.

Analysis of Options:

* Option A (The file server has been cloned): Correct. Cloning a file server (e.g., creating a duplicate file server instance via cloning in Nutanix) is not a supported configuration for Data Lens. Data Lens relies on a unique file server identity to manage its metadata and analytics. If the file server has been cloned, Data Lens may fail to enable due to conflicts in identity or metadata, as the cloned file server may not be properly registered or recognized by Data Lens.

* Option B (SSR is enabled on the file server): Incorrect. Self-Service Restore (SSR) is a feature in Nutanix Files that allows users to recover previous versions of files in SMB shares. Enabling SSR does not affect the ability to enable Data Lens, as the two features are independent and can coexist on a file server.

* Option C (The file server is in a Protection Domain): Incorrect. A Protection Domain in Nutanix is used for disaster recovery (DR) of VMs or Volume Groups, not file servers directly. Nutanix Files uses replication policies (e.g., NearSync) for DR, not Protection Domains. Even if the file server is part of a replication setup, this does not prevent Data Lens from being enabled.

* Option D (The file server has blacklisted file types): Incorrect. Blacklisting file types in Nutanix Files prevents certain file extensions from being stored on shares (e.g., for security reasons). However, this feature does not affect the ability to enable Data Lens, which operates at a higher level to analyze file metadata and user activity, regardless of file types.

Why Option A?

Cloning a file server creates a duplicate instance that may not be properly registered with Data Lens, leading to conflicts in identity, metadata, or configuration. Nutanix documentation specifies that Data Lens requires a uniquely deployed file server, and cloning can cause issues when enabling the service, making this the most likely cause of the administrator's difficulty.

Exact Extract from Nutanix Documentation:

From the Nutanix Data Lens Administration Guide (available on the Nutanix Portal):

"Data Lens requires a uniquely deployed file server to enable its services. Cloning a file server is not supported, as it may result in conflicts with Data Lens metadata and configuration. If a file server has been cloned, Data Lens may fail to enable, and the file server must be redeployed or re-registered to resolve the issue."

NEW QUESTION # 100

An administrator is tasked with performing an upgrade to the latest Objects version.

What should the administrator do prior to upgrade Objects Manager?

- A. Upgrade Lifecycle Manager
- **B. Upgrade AOS**
- C. Upgrade MSP
- D. Upgrade Objects service

Answer: B

Explanation:

Before upgrading Objects Manager, the administrator must upgrade AOS to the latest version. AOS is the core operating system that runs on each node in a Nutanix cluster and provides the foundation for Objects Manager and Objects service. Upgrading AOS will ensure compatibility and stability for Objects components.

NEW QUESTION # 101

What is the primary criteria that should be considered for performance-sensitive application shares with sequential I/O?

- A. IOPS
- **B. Throughput**
- C. Connections
- D. Block Size

Answer: B

Explanation:

The primary criteria that should be considered for performance-sensitive application shares with sequential I/O is throughput.

Throughput is a measure of how much data can be transferred or processed in a given time period. Throughput is usually expressed in megabytes per second (MB/s) or gigabytes per second (GB/s). Sequential I/O is a type of I/O pattern where data is read or

written in a sequential order, such as streaming media, backup, or archive applications. Sequential I/O typically requires high throughput to transfer large amounts of data quickly and efficiently. Reference: Nutanix Files Administration Guide, page 25; Nutanix Files Solution Guide, page 10
