Snowflake SnowPro Core Certification Exam Sample Questions (Q453-Q458):

NEW QUESTION # 453

Which type of URL gives permanent access to files in cloud storage?

- A. File URL
- **B. Pre-signed URL**
- C. Scoped URL
- D. Account URL

Answer: B

Explanation:

* A Pre-signed URL provides temporary or permanent access to specific files in cloud storage (e.g., S3, Azure Blob, or Google Cloud Storage) by embedding credentials or access permissions into the URL.

* In Snowflake, pre-signed URLs are commonly used to securely access files in external stages or other cloud storage without sharing permanent credentials.

* Why Pre-signed URL?

* Allows you to specify access conditions, such as expiration time or specific permissions.

* Useful for secure, direct access to files stored externally.

Why Other Options Are Incorrect:

* B. Account URL: Refers to the URL for accessing Snowflake accounts, not files in cloud storage.

* C. Scoped URL: Not a valid term in Snowflake or cloud storage.

* D. File URL: Not a specific type of secure URL.

NEW QUESTION # 454

Which Snowflake table is an implicit object layered on a stage, where the stage can be either internal or external?

- **A. Directory table**
- B. Temporary table
- C. Transient table
- D. A table with a materialized view

Answer: A

Explanation:

A directory table in Snowflake is an implicit object layered on a stage, whether internal or external. It allows users to query the contents of a stage as if it were a table, providing metadata about the files stored in the stage, such as filenames, file sizes, and last modified timestamps.

NEW QUESTION # 455

How can customer data be restricted by country for a global company using a multi-tenant environment?

- A. Implement a new account structure and create sub-accounts for each country. Then replicate the required data.
- B. Implement a column-level security policy in the customer table that restricts access based on the user's geographic location.
- C. Implement a secure User-Defined Function (UDF) and use a secure data share for each country.
- **D. Implement a row-level security policy in the customer table that looks at a mapping table identifying which users should have access to what data.**

Answer: D

NEW QUESTION # 456

A Snowflake user accidentally deleted a table. The table no longer exists, but the session is within the data retention period. How can the table be restored using the LEAST amount of operational overhead?

- A. Recreate the table and reload the data.
- B. Clone the table schema as it existed before the table was dropped.
- **C. Run the UNDROP command against the table.**
- D. Clone the database as it existed before the table was dropped.

Answer: C

Explanation:

In Snowflake, if a table is accidentally dropped but still within the data retention period (also known as "Time Travel"), the simplest and most efficient recovery method is the UNDROP command. This command restores the deleted table to its previous state with minimal operational effort. Since Snowflake retains dropped table data for a specific retention period (up to 90 days for the Enterprise edition), UNDROP can quickly recover the table without the need for complex cloning or data reloading processes, making it ideal for accidental deletions.

NEW QUESTION # 457

Which security models are used in Snowflake to manage access control? (Select TWO).

- A. Identity Access Management (IAM)
- B. Mandatory Access Control (MAC)
- **C. Role-Based Access Control (RBAC)**
- D. Security Assertion Markup Language (SAML)
- **E. Discretionary Access Control (DAC)**

Answer: C,E

Explanation:

Snowflake uses both Discretionary Access Control (DAC) and Role-Based Access Control (RBAC) to manage access control. DAC allows object owners to grant access privileges to other users. RBAC assigns permissions to roles, and roles are then granted to users, making it easier to manage permissions based on user roles within the organization.
