UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q23-Q28):

NEW QUESTION # 23

What is the role of the Automation Developer in the Automation Implementation Methodology?

- A. Defining access and infrastructure needs
- **B. Building automation workflows and resolving UAT defects**
- C. Managing internal escalations
- D. Performing business case validation

Answer: B

Explanation:

The Automation Developer is responsible for building the automation workflows in accordance with the Solution Design Document (SDD) and the Process Definition Document (PDD). Their work includes following UiPath best practices, ensuring reusability, scalability, and maintainability of code, and integrating various UiPath components like Studio, Orchestrator, and Document Understanding if needed.

In addition to development, the developer is also responsible for fixing any defects found during UAT, ensuring that the automation meets business requirements before being deployed to production. Throughout the development and Hypercare stages, they may also make improvements or handle minor changes based on stakeholder feedback.

The Automation Developer also plays a key communication role by keeping the project manager and solution architect informed of any blockers, changes, or risks. Their ability to transform business requirements into effective automation is critical to the project's success.

NEW QUESTION # 24

Which stage in the automation implementation strategy involves selecting critical quick wins and important low-hanging fruits for initial focus?

- **A. Pilot phase**
- B. Second implementation wave
- C. Final wave
- D. Third implementation wave

Answer: A

Explanation:

The Pilot phase is the stage in the automation implementation strategy where organizations focus on quick wins and low-hanging fruits—those automation opportunities that are easy to implement, carry minimal risk, and can deliver immediate, visible value. These processes typically have low complexity but high impact, such as frequent, repetitive, rules-based tasks.

The purpose of the Pilot phase is to build early momentum, validate the chosen automation tools and methodology, and create internal success stories. These successes help establish credibility for the automation program, gain stakeholder trust, and generate enthusiasm for further automation expansion.

By starting with manageable and well-scoped automations, teams can also fine-tune their implementation practices, identify potential pitfalls, and standardize governance and documentation practices for future waves. These learnings serve as a foundation for scaling automation in subsequent phases such as the second and third waves, which typically involve more complex or cross-functional processes.

Skipping or mismanaging the Pilot phase can lead to early failures, resistance, and slow adoption. Therefore, it is essential to choose this phase's automation candidates carefully based on business value and ease of implementation.

NEW QUESTION # 25

Which of the following best describes how automation software robots operate?

- A. They require constant human supervision.
- B. They write code autonomously.
- C. They physically interact with machines to perform tasks.
- **D. They mimic human actions to interact with digital systems and applications.**

Answer: D

Explanation:

Automation software robots, particularly those built using UiPath, operate by mimicking human actions to interact with digital systems and applications. This includes actions such as clicking buttons, typing into fields, reading data from screens, extracting information from documents, navigating applications, and triggering system events. Their behavior is defined through automation workflows created by developers using tools like UiPath Studio.

These robots do not require constant supervision; unattended robots operate autonomously, while attended robots are triggered by users. They also do not interact physically with machines. Instead, they work entirely within virtual environments, desktops, and applications.

By replicating human behavior in digital workflows, robots can perform repetitive, rule-based tasks consistently, quickly, and without fatigue. This enables organizations to improve operational efficiency, reduce human error, increase accuracy, and free employees to focus on more strategic work.

Software robots do not write code on their own-developers design their workflows. However, with AI enhancements, they can assist in automation development. Still, their core functionality relies on executing predefined instructions that simulate human interaction with digital systems.

NEW QUESTION # 26

Which of the following best describes a benefit of having a structured automation implementation methodology?

- A. Reduces dependency on documentation
- **B. Ensures consistent quality and faster implementations**
- C. Allows skipping of UAT phase
- D. Increases manual intervention in processes

Answer: B

Explanation:

Having a structured automation implementation methodology, like UiPath's, ensures consistent quality, faster and more reliable implementations, and smoother handoffs between teams. By following a defined sequence of stages - from Kickoff to Project Closure - teams can operate with clarity and efficiency.

This methodology reduces ambiguity, improves collaboration between business and technical teams, and provides a framework for issue escalation and risk management. It also ensures that each process is thoroughly analyzed, designed, built, and validated before moving to production.

Without such structure, projects may suffer from misalignment, unclear responsibilities, delays, or quality issues. A strong methodology acts as a roadmap for delivering automation in a scalable, repeatable, and maintainable way.

NEW QUESTION # 27

Who is responsible for managing internal processes and escalations during automation implementation?

- A. Solution Architect
- B. Automation Developer
- **C. Client Team Project Manager**
- D. Infrastructure Engineer

Answer: C

Explanation:

The Client Team Project Manager is responsible for managing internal processes and handling any escalations that may arise during the automation implementation lifecycle. This individual acts as the liaison between the business and the technical Implementation Team, ensuring alignment, timely responses, and that the business requirements are met.

Their key responsibilities include stakeholder communication, ensuring availability of business SMEs (Subject Matter Experts), resolving conflicts, managing dependencies on internal systems or departments, and escalating issues internally when roadblocks occur. This ensures the smooth execution of the project from the business side.

Effective management from the Client Team Project Manager is critical for success, as delays or miscommunications from the business side can stall the implementation timeline or lead to incomplete automation requirements. Their collaboration with the Implementation Team's project manager also ensures project tracking, scope control, and successful delivery within budget and time.
