The page of our Managing-Cloud-Security simulating materials provides demo which are sample questions. The purpose of providing demo is to let customers understand our part of the topic and what is the form of our Managing-Cloud-Security study materials when it is opened? In our minds, these two things are that customers who care about the Managing-Cloud-Security Exam may be concerned about most. We will give you our software which is a clickable website that you can visit the product page.

Many candidates find the WGU Managing-Cloud-Security exam preparation difficult. They often buy expensive study courses to start their WGU Managing-Cloud-Security certification exam preparation. However, spending a huge amount on such resources is difficult for many WGU Managing-Cloud-Security Exam applicants.

New Managing-Cloud-Security Study Guide & Managing-Cloud-Security Exam Actual Tests

The WGU Managing-Cloud-Security desktop-based practice exam software is beneficial for you to evaluate and enhance your knowledge before taking the WGU Managing Cloud Security (JY02) Exam Questions. All of the features of our online Managing-Cloud-Security Practice Test software are included in our desktop windows-based WGU Managing-Cloud-Security practice exam software.

WGU Managing Cloud Security (JY02) Sample Questions (Q131-Q136):

NEW QUESTION # 131

Which cloud architecture model provides application development services?

- A. Infrastructure as a Service (IaaS)
- B. Software as a Service (SaaS)
- C. Security as a Service (SECaaS)
- **D. Platform as a Service (PaaS)**

Answer: D

Explanation:

Platform as a Service (PaaS) provides application development services in cloud environments. Managing Cloud documentation explains that PaaS delivers development frameworks, programming languages, libraries, databases, and testing tools required to

build and deploy applications.

This model eliminates the need to manage infrastructure and operating systems, allowing developers to rapidly create, test, and deploy applications. PaaS also supports scalability and integration with other cloud services.

SaaS delivers completed applications, IaaS provides raw infrastructure, and SECaaS focuses on security services. Therefore, PaaS is the correct model for application development services.

NEW QUESTION # 132

Which security device allows customers to redirect traffic?

- **A. Web application firewalls**
- B. Intrusion detection and prevention systems
- C. Cryptographic key management
- D. Security information and event management

Answer: A

Explanation:

A Web Application Firewall (WAF) allows customers to redirect traffic as part of securing cloud-hosted applications. Managing Cloud principles explain that WAFs operate at the application layer and can inspect, filter, allow, block, or redirect HTTP and HTTPS traffic based on defined security rules.

Traffic redirection is commonly used to route suspicious or malicious requests away from protected applications, forward traffic to alternate services, or enforce secure communication paths. WAFs can also integrate with load balancers and content delivery networks to manage traffic flow efficiently while protecting applications from attacks such as SQL injection, cross-site scripting, and denial-of-service attempts.

The other options do not provide traffic redirection. SIEM systems aggregate and analyze logs, intrusion detection and prevention systems focus on detection and blocking, and cryptographic key management handles encryption keys. Therefore, a web application firewall is the correct answer.

NEW QUESTION # 133

A user creates new financial documents that will be stored in the cloud. Which action should the user take before uploading the documents to protect them against threats such as packet capture and on-path attacks?

- **A. Encryption**
- B. Metadata labeling
- C. Hashing
- D. Change tracking

Answer: A

Explanation:

Before transmitting sensitive financial data to the cloud, the best defense against interception threats like packet capture and man-in-the-middle attacks is encryption. Encryption protects data in transit by converting plain text into cipher text, which can only be deciphered with the correct keys.

Hashing provides integrity verification but does not secure confidentiality. Change tracking monitors modifications but does not prevent interception. Metadata labeling adds context but does not protect against on-path attackers.

Using strong encryption protocols (e.g., TLS) ensures that even if traffic is intercepted, the attacker cannot read the data. Encryption also aligns with compliance requirements such as PCI DSS, which mandates encryption for financial data during transmission. By encrypting before upload, the user ensures end-to-end confidentiality across potentially insecure networks.

NEW QUESTION # 134

Which cloud model is owned and operated by a vendor and then sold, leased, or rented to someone else?

- A. Private
- B. Hybrid
- C. Community
- **D. Public**

Answer: D

Explanation:

The Public cloud model is owned and operated by a vendor and offered to customers through sale, lease, or rental arrangements. Managing Cloud principles describe public cloud providers as entities that deliver shared infrastructure, platforms, or applications to multiple customers over the internet.

In this model, the cloud service provider manages the infrastructure, maintenance, and security of the environment, while customers consume services on a pay-as-you-go or subscription basis. Public clouds offer scalability, flexibility, and cost efficiency but provide less control over underlying systems.

Private clouds are dedicated to a single organization, hybrid clouds combine multiple models, and community clouds serve specific groups. Therefore, the public cloud model best fits the description.

NEW QUESTION # 135

What is at risk in the cloud environment when the management console is breached?

- A. Amount of content on the image store
- B. Sensitive information that images and snapshots can contain
- C. Entire infrastructure that the control plane administers
- D. Breakout of a guest OS that can access other hypervisors

Answer: C

Explanation:

When a management console is breached, the entire infrastructure managed by the control plane is at risk. Managing Cloud guidance explains that the management console provides administrative access to cloud resources such as virtual machines, networks, storage, and identity services.

A compromise of this interface allows attackers to create, modify, or delete resources, escalate privileges, access sensitive data, and disrupt operations across the entire cloud environment. Because the management console controls provisioning and configuration, its compromise represents a critical security failure.

The other options represent limited risks, but none match the broad impact of losing control over the management plane. Therefore, the correct answer is the entire infrastructure administered by the control plane.

NEW QUESTION # 136

.....

As the old saying goes people change with the times. People must constantly update their stocks of knowledge and improve their practical ability. Passing the test Managing-Cloud-Security certification can help you achieve that and buying our Managing-Cloud-Security test practice materials can help you pass the Managing-Cloud-Security test smoothly. Our Managing-Cloud-Security study question is superior to other same kinds of study materials in many aspects. Our Managing-Cloud-Security test bank covers the entire syllabus of the test and all the possible questions which may appear in the test. You will pass the Managing-Cloud-Security exam for sure.
