

1z1-076 Test Dumps.zip - 1z1-076 PDF Dumps Files

P.S. Free & New 1z1-076 dumps are available on Google Drive shared by Pass4training: https://drive.google.com/open?id=1zLsgL8BRns9J6uf9PKYRvE_or67TVbNB

When you are studying for the 1z1-076 exam, maybe you are busy to go to work, for your family and so on. How to cost the less time to reach the goal? It's a critical question for you. Time is precious for everyone to do the efficient job. If you want to get good 1z1-076 prep guide, it must be spending less time to pass it. Exactly, our product is elaborately composed with major questions and answers. We are choosing the key from past materials to finish our 1z1-076 Guide Torrent. It only takes you 20 hours to 30 hours to do the practice. After your effective practice, you can master the examination point from the 1z1-076 exam torrent. Then, you will have enough confidence to pass it.

If you want to get a desirable opposition and then achieve your career dream, you are a right place now. Our 1z1-076 study tool can help you pass the exam. So, don't be hesitate, choose the 1z1-076 test torrent and believe in us. Let's strive to our dreams together. Life is short for us, so we all should cherish our life. Our 1z1-076 Guide Torrent can help you to save your valuable time and let you have enough time to do other things you want to do. Just buy our 1z1-076 exam questions, then you will pass the 1z1-076 exam easily.

Free PDF 2026 Perfect 1z1-076: Oracle Database 19c: Data Guard Administration Test Dumps.zip

These Oracle 1z1-076 exam practice tests identify your mistakes and generate your result report on the spot. To make your success a certainty, Pass4training offers free updates on our Oracle 1z1-076 real dumps for up to three months. It means all users get the latest and updated Oracle 1z1-076 practice material to clear the Oracle Database 19c: Data Guard Administration 1z1-076 certification test on the first try. We are a genuine brand working to smoothen up your 1z1-076 exam preparation.

Oracle Database 19c: Data Guard Administration Sample Questions (Q22-Q27):

NEW QUESTION # 22

Examine the fast-start failover configuration:

```

DGMGRL> show fast_start failover;

Fast-Start Failover: Enabled in Zero

  Protection Mode: MaxAvailability
  Lag Limit: 0 seconds

  Threshold: 180 seconds
  Active Target: South_Sales
  Potential Targets: "East_Sales,
    East_Sales valid
    West_Sales valid
  Observer: observer.example.com
  Shutdown Primary: TRUE
  Auto-reinstate: TRUE
  Observer Reconnect: (none)
  Observer Override: FALSE

Configurable Failover Conditions
  Health Conditions:
    Corrupted Controlfile YES
    Corrupted Dictionary YES
    Inaccessible Logfile NO
    Flashback Archiver YES

```

- A. The observer will initiate a failover when the primary database is unable to produce local archived redo log files.
- B. The observer is running.
- C. You must disable fast-start failover first to change the fast-start failover target to East sales.
- D. If South_Sales develops a problem and cannot be the target of a failover, the broker automatically changes the fast-start failover target to one of the other candidate targets.
- E. A failover may occur if the observer has lost connectivity to the primary database, even if the Fast-Start Failover target standby database has a good connection to the primary database

Answer: A,B,E

NEW QUESTION # 23

Which three are prerequisites for enabling Fast-Start Failover?

- A. Flashback Database must be enabled on the Fast-Start Failover target standby database.
- B. The Fast-Start Failover target standby database must receive REDO synchronously when the configuration operates in Maximum Availability mode.
- C. A static service name must be configured only for the Fast-Start Failover target standby database.
- D. Flashback Database must be enabled on the primary database.
- E. The Fast-Start Failover target standby database may receive REDO either synchronously or asynchronously when the configuration operates in Maximum Performance mode.

Answer: A,B,D

NEW QUESTION # 24

Your Data Guard environment consists of these components and settings:

1. A primary database
2. Two remote physical standby databases
3. The redo transport mode is set to sync
4. Real-time query is enabled for both standby databases
5. The DB_BLOCK_CHECKING parameter is set to TRUE on both standby databases. You notice an increase in redo apply lag time on both standby databases.

Which two would you recommend to reduce the redo apply lag on the standby databases?

- A. Decrease the redo log file size on the primary database.
- B. Lower DB_BLOCK_CHECKING to MEDIUM or low on the standby databases.
- C. Increase the number of standby redo log files on the standby databases.
- D. Increase the size of the buffer cache on the physical standby database instances.
- E. Increase the size of standby redo log files on the standby databases.

Answer: B,E

Explanation:

To reduce the redo apply lag on standby databases, one could increase the size of the standby redo log files.

Larger redo log files can accommodate more redo data, which may reduce the frequency of log switches and allow for more continuous application of redo data. Additionally, lowering the DB_BLOCK_CHECKING parameter to MEDIUM or LOW on the standby databases can help improve redo apply performance. High block checking can impose additional CPU overhead during the application of redo data, potentially increasing apply lag times. By reducing the level of block checking, you can lessen this overhead and help reduce the apply lag.

NEW QUESTION # 25

Which three actions are performed by the START PLAN procedure of the DBMS ROLLING package?

- A. converting the designated physical standby database into a logical standby database
- B. creating a guaranteed restore point on the standby databases
- C. building a LogMiner dictionary on the primary database instance
- D. switching the primary database to the logical standby role
- E. creating a guaranteed restore point on the primary database
- F. starting media recovery on all the Leading Group Standby databases

Answer: B,C,E

Explanation:

The DBMS_ROLLING package facilitates a rolling upgrade process across a Data Guard configuration. The START PLAN procedure in particular handles several critical actions, including:

- * Creating a guaranteed restore point on the standby databases (B): This ensures that the standby databases can be reverted to their state before the rolling upgrade process in case of any issues.
- * Building a LogMiner dictionary on the primary database instance (C): This is necessary for logical standby databases to interpret redo data during the SQL Apply process.
- * Creating a guaranteed restore point on the primary database (D): Similar to the standby databases, this ensures that the primary database can be reverted to a known good state if necessary.

NEW QUESTION # 26

Which THREE statements are true about snapshot standby databases?

- A. A snapshot standby database must be opened at least once in read-write mode before it can be converted into a physical standby database.
- B. A snapshot standby database can be the only standby database in a Maximum Protection Oracle Data Guard configuration.
- C. If datafiles grow while a database is a snapshot standby database, then they shrink when converted back to a physical standby database.
- D. Snapshot standby databases may be used for rolling database upgrades.
- E. A guaranteed restore point is created automatically when a physical standby database is converted into a snapshot standby database.

Answer: A,D,E

NEW QUESTION # 27
