Are you one of them? Are you still worried and confused because of the the various exam materials and fancy training courses exam? Actual4Cert is the right choice for you. Because we can provide you with a comprehensive exam, including questions and answers. All of these will help you to acquire a better knowledge, we are confident that you will through Actual4Cert the Docker

DCA Certification Exam. This is our guarantee to all customers.

Docker Certified Associate (DCA) Exam Sample Questions (Q112-Q117):

NEW QUESTION # 112

The Kubernetes yaml shown below describes a clusterIP service.

Is this a correct statement about how this service routes requests?

Solution: Traffic sent to the IP of this service on port 80 will be routed to port 8080 in a random pod with the label app: nginx.

- A. No
- B. Yes

Answer: A

Explanation:

The statement is not entirely correct. In Kubernetes, a service of type ClusterIP routes traffic sent to its IP address to the pods selected by its label selector¹. However, the port to which the traffic is routed in the pod is determined by the targetPort specified in the service definition¹. If targetPort is not specified, it defaults to being the same as the port field¹. In the provided YAML snippet, there is no targetPort specified for port 80, so we cannot confirm that the traffic will be routed to port 8080 in the pod. Therefore, without additional information about the pod configuration, we cannot verify the provided solution statement¹.

NEW QUESTION # 113

Will this command display a list of volumes for a specific container?

Solution: docker volume logs nginx --containers'

- A. No
- B. Yes

Answer: A

NEW QUESTION # 114

Is this a Linux kernel namespace that is disabled by default and must be enabled at Docker engine runtime to be used?

Solution: mnt

- A. No
- B. Yes

Answer: A

Explanation:

The mnt namespace is not disabled by default and does not need to be enabled at Docker engine runtime to be used. The mnt namespace is one of the six Linux kernel namespaces that Docker uses to isolate containers from the host system¹. The mnt namespace allows a container to have its own set of mounted filesystems and root directories, which are different from the host's². This means that a container can access only the files and directories that are mounted inside its namespace, and not the ones that are mounted on the host or other containers. The mnt namespace is created automatically when a container is started, and it is destroyed when the container stops³.

References:

* Isolate containers with a user namespace | Docker Docs

* The mnt namespace - Docker Cookbook - Second Edition

* Container security fundamentals part 2: Isolation & namespaces

mnt is not a Linux kernel namespace that is disabled by default and must be enabled at Docker engine runtime to be used. According to the official documentation, mnt is one of the namespaces that are enabled by default when using namespaces for isolation.

NEW QUESTION # 115

You want to create a container that is reachable from its host's network. Does this action accomplish this?

Solution: Use either EXPOSE or --publish to access the containers on the bridge network

- A. Yes
- B. No

Answer: A

NEW QUESTION # 116

Is this the purpose of Docker Content Trust?

Solution: Verify and encrypt Docker registry TLS.

- A. No
- B. Yes

Answer: A

Explanation:

Docker Content Trust (DCT) is a feature that allows users to verify the integrity and publisher of container images they pull or deploy from a registry server, signed on a Notary server¹². DCT does not verify or encrypt the Docker registry TLS, which is a separate mechanism for securing the communication between the Docker client and the registry server. The purpose of DCT is to ensure that the images are not tampered with or maliciously modified by anyone other than the original publisher³. Reference:
