## Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q27-Q32):

### NEW QUESTION # 27

An integration team uses Anypoint Platform and follows MuleSoft's recommended approach to full lifecycle API development. Which step should the team's API designer take before the API developers implement the API specification?

- A. Use API Manager to version the API specification
- B. Generate test cases using MUnit so the API developers can observe the results of running the API
- **C. Publish the API specification to Exchange and solicit feedback from the API's consumers**
- D. Use the scaffolding capability of Anypoint Studio to create an API portal based on the API specification

**Answer: C**

Explanation:

Design-First Feedback Loop: In the MuleSoft API Lifecycle, after designing the API specification (RAML/OAS) in Design Center, the critical next step is to Publish to Exchange.

Mocking & Validation: Once in Exchange, the API creates a "Mocking Service." This allows potential consumers (frontend devs, mobile devs) to make test calls against the design before any backend code is written.

Purpose: This solicits feedback to ensure the design meets business needs. If changes are needed, they are made to the spec cheap and fast, rather than rewriting complex code later (Implementation phase).

### NEW QUESTION # 28

An integration team follows MuleSoft's recommended approach to full lifecycle API development. 9

- A. Validate the API specification
- B. Use the API specification to monitor the MuleSoft application
- C. Use the API specification to build the MuleSoft application
- D. Design the API specification

**Answer: C**

Explanation:

(Note: The question implies "What is the next step after design/validation?" or "How is the spec used?". Based on the answer key A, the context is how the spec drives development).

API-Led Connectivity & Design-First: MuleSoft promotes a "Design-First" approach. You first write the RAML or OAS specification.

MuleSoft scaffolding: Once the specification is designed and published to Exchange, the developer imports it into Anypoint Studio. Studio then scaffolds (automatically generates) the Mule flows based on the API Specification.

The Workflow:

Design: Create the API contract (RAML/OAS).

Publish: Publish to Exchange.

Build (Answer A): Use the API specification to generate the flow structure (APIkit Router) and implement the logic.

This ensures the implementation strictly matches the design defined in the earlier phases.

### NEW QUESTION # 29

An organization is choosing between API-led connectivity and other integration approaches.

- A. Increased developer productivity through self-service of API assets
- B. Higher outcome repeatability through centralized development
- C. Improved security through adoption of monolithic architectures
- D. Greater project predictability through tight coupling of systems

**Answer: A**

Explanation:

The Value Proposition: A primary goal of API-led connectivity is to close the IT delivery gap. It achieves this by turning APIs into reusable Assets published to Exchange. 8 Self-Service: When assets are discoverable, other developers (e.g., Line of Business developers) can reuse them without waiting for central IT to build everything from scratch. This "Self-Service" model significantly increases overall developer productivity.

Why others are incorrect:

Tight Coupling (B): API-led promotes loose coupling. Tight coupling makes systems brittle and hard to change (Point-to-Point).

Centralized Development (C): Creates a bottleneck. API-led enables federated development.

Monolithic (D): API-led breaks monoliths into composable services (Microservices/APIs).

### NEW QUESTION # 30

What is a defining characteristic of an Integration-Platform-as-a-Service (IPaaS)?

- A. Code-first
- **B. Cloud-based**
- C. On-premises
- D. No-code

**Answer: B**

Explanation:

Definition of iPaaS: Gartner and MuleSoft define iPaaS (Integration Platform as a Service) as a suite of cloud services enabling the development, execution, and governance of integration flows connecting any combination of on-premises and cloud-based processes, services, applications, and data within individual or across multiple organizations.

The Key Characteristic: The "as a Service" suffix explicitly denotes a Cloud-based delivery model 1111111111.

MuleSoft Context: CloudHub is the iPaaS component of the Anypoint Platform. It is a fully managed, multi-tenant, cloud-based integration platform where you deploy API implementations without managing the underlying hardware.

### NEW QUESTION # 31

An API client makes an HTTP request to an API gateway with an Accept header containing the value "application/json".

- A. status('healthy')
- **B. {"status": "healthy"}**
- C. status: healthy
- D. status>healthy</status>

**Answer: B**

Explanation:

Content Negotiation: The HTTP Accept header is used by the client to tell the server what media type (format) it expects in the response 4444.

application/json: This MIME type explicitly requests JSON (JavaScript Object Notation).

Analyzing the Options:

(B) {"status": "healthy"} is valid JSON format (Key-Value pair wrapped in braces).

(C) status>healthy</status> is XML.

(A) is YAML or Plain Text.
