## Fortinet EMEA Advanced Support Exam Sample Questions (Q41-Q46):

### NEW QUESTION # 41

Which of these BGP paths will be the preferred one ?

- A. Prefer the path with the highest Local Preference value
- B. Prefer External path (learned via EBGP) over Internal path (IBGP)
- C. Prefer the path with the lowest Multi-Exit Discriminator (MED)
- D. Prefer the path with the shortest AS Path

**Answer: A**

Explanation:

BGP path selection follows a specific order of attributes to determine the best path. The process prefers the path with the highest local preference first, as it is one of the earliest steps in the decision process. Local preference is used within an AS to influence outbound traffic. Only if local preferences are equal does it move to the next criteria, such as shortest AS path. The AS path length is considered after local preference, MED after that, and eBGP over iBGP even later. Therefore, among the options, the highest local preference (D) is the most preferred criterion. The original document's answer B is incorrect based on standard BGP selection rules implemented in Fortinet. Exact extract: This article describes the BGP route selection process. Scope FortiGate. Solution Consider only routes with no AS loops and a valid next hop. BGP makes routing decisions based on path, network policies and rulesets ... select the route with the lowest router ID as the best path. Network. Type. To achieve this, multiple route selection techniques can be used. Some are protocol-agnostic (for example, weight) and others are protocol-specific (for example ...).

### NEW QUESTION # 42

TCP protocol can be used for data delivery via multicast

- A. Yes
- B. No

**Answer: B**

Explanation:

TCP is a unicast, connection-oriented protocol that ensures reliable data delivery between two endpoints using sequence numbers and acknowledgments. Multicast, which sends data to multiple recipients, is supported by UDP, not TCP, due to TCP's requirement for a direct connection. Fortinet devices handle multicast traffic via UDP-based protocols like IGMP or PIM. Exact extract: "TCP is a unicast protocol that establishes a reliable connection between two devices... Multicast traffic, such as streaming or group communications, relies on UDP, as TCP does not support multicast delivery."

### NEW QUESTION # 43

Which FortiGate feature supports load balancing across multiple WAN links?

- A. Link Aggregation
- B. Virtual Routing
- C. Multi-Path Routing
- D. SD-WAN

**Answer: D**

Explanation:

FortiGate's SD-WAN feature enables load balancing and intelligent traffic steering across multiple WAN links based on criteria like bandwidth, latency, or application. Link Aggregation (B) bonds interfaces, Virtual Routing (C) is VRF, and Multi-Path Routing (D) is not a standard term. Exact extract: "SD-WAN enables load balancing and traffic steering across multiple WAN links, optimizing performance and reliability based on configured rules and metrics."

#### NEW QUESTION # 44

Link aggregation allows network devices to \_\_\_\_\_

- A. Restrict the bandwidth
- B. Increase bandwidth of an interface
- **C. Increase bandwidth by binding physical interfaces into a single channel**
- D. None of the above

**Answer: C**

Explanation:

Link aggregation, also known as IEEE 802.3ad or 802.1ax, enables the binding of multiple physical interfaces to form a single logical interface, which increases the overall bandwidth and provides redundancy. This is achieved by combining the bandwidth of the individual links into one aggregated link. For example, if two

1Gbps interfaces are aggregated, the logical link can provide up to 2Gbps bandwidth. This configuration is commonly used in FortiGate devices to enhance network performance without replacing hardware. The option B correctly describes this by stating "Increase bandwidth by binding physical interfaces into a single channel," which aligns with the official description. Incorrect options include A, which is vague and does not specify the method of binding multiple interfaces; C, which is the opposite of the purpose; and D, which is invalid.

Exact extract: Link aggregation (IEEE 802.3ad/802.1ax) enables you to bind two or more physical interfaces together to form an aggregated (combined) link. This new link ... Link aggregation combines multiple physical interfaces into a single logical interface, increasing bandwidth and link redundancy. Traffic is distributed evenly.

#### NEW QUESTION # 45

What is the role of the FortiGate 'set srcintf' command in a firewall policy?

- A. Sets the source IP address range
- B. Configures the source NAT interface
- C. Defines the destination interface for traffic
- **D. Specifies the source interface for traffic matching**

**Answer: D**

Explanation:

The 'set srcintf' command in a FortiGate firewall policy specifies the source interface from which traffic originates, helping define the policy's scope. It does not set the destination interface (B), source IP range (C), or NAT interface (D). Exact extract: "The 'set srcintf' command in a firewall policy specifies the source interface for incoming traffic, allowing FortiGate to match packets based on their entry interface."
