CompTIA Linux+ Certification Exam Sample Questions (Q73-Q78):

NEW QUESTION # 73

Which of the following passwords is the most complex?

- A. H3s@1dSh3t0|d
- B. he\$@ID\$heTold
- C. HeSaidShetold
- D. H3sa1dt01d

Answer: A

Explanation:

Password complexity is a fundamental concept within the Security domain of CompTIA Linux+ V8. Complex passwords significantly reduce the risk of successful brute-force, dictionary, and credential-stuffing attacks.

Linux+ emphasizes evaluating passwords based on length, character variety, unpredictability, and resistance to common word patterns.

Option C, H3s@1dSh3t0|d, is the most complex password among the choices. It demonstrates strong security characteristics by incorporating:

Uppercase letters (H, S)

Lowercase letters (s, d, t)

Numbers (3, 1, 0)

Multiple special characters (@, |)

A longer overall length compared to some other options

Additionally, option C uses character substitution (leet-style) in a way that breaks up recognizable words more effectively than the other choices. This significantly increases entropy and makes the password harder to guess using rule-based or hybrid cracking techniques.

Option A includes uppercase letters and numbers but lacks special characters and is relatively short. Option B includes special characters and mixed case, but it still closely resembles readable words, making it more susceptible to dictionary-based attacks.

Option D uses only alphabetic characters and clear word patterns, making it the weakest choice.

Linux+ V8 documentation highlights that the strongest passwords combine length with diverse character classes and minimal predictability. Password C best meets all of these criteria and would score highest against common password-cracking strategies. Therefore, the correct answer is C. H3s@1dSh3t0|d.

NEW QUESTION # 74

A systems administrator needs to open the DNS TCP port on a Linux system from network 10.0.0.0/24. Which of the following commands should the administrator use for this task?

- A. `ufw allow dns/tcp to 10.0.0.0/24`
- B. `ufw disable from 10.0.0.0/24`
- C. `ufw enable 53/tcp from 10.0.0.0/24`
- D. `ufw allow 53/tcp from 10.0.0.0/24`

Answer: D

Explanation:

The `ufw allow 53/tcp from 10.0.0.0/24` command explicitly opens TCP port 53 (DNS) for connections coming from the 10.0.0.0/24 network, which is the correct way to configure this firewall rule.

NEW QUESTION # 75

A systems administrator receives reports about connection issues to a secure web server. Given the following firewall and web server outputs:

Firewall output:

Status: active

To Action From

443/tcp DENY Anywhere

443/tcp (v6) DENY Anywhere (v6)

Web server output:

tcp LISTEN 0 4096 *:443 :

Which of the following commands best resolves this issue?

- A. **ufw delete deny https/tcp**
- B. ufw allow 4096/tcp
- C. ufw allow 80/tcp
- D. ufw disable

Answer: A

NEW QUESTION # 76

A systems administrator is troubleshooting a network error on a Linux server. Given the following:

Which of the following is the reason for the error?

- A. The wrong netmask is assigned.
- B. The network adapter is down.
- C. The default route is missing.
- D. **The DNS resolver is not configured.**

Answer: D

Explanation:

The system cannot resolve the hostname because no DNS servers are configured, as indicated by the absence of nameserver entries in the resolver configuration file, even though network connectivity and routing are present.

NEW QUESTION # 77

The development team asks a Linux administrator to help diagnose a connectivity issue that is occurring with a newly developed software. The Linux administrator reviews the following output:

```
$ wget -v https://api.newapp.comptia.org/v2/health
```

```
Resolving proxy.comptia.org (proxy.comptia.org)... connected.
```

```
ERROR: The certificate of 'api.newapp.comptia.org' is not trusted.
```

```
ERROR: The certificate of 'api.newapp.comptia.org' does not have a known issuer.
```

Which of the following actions is the best way to resolve the issue?

- A. Add option `--no-check-certificate` to `wget` command to permanently resolve the problem.
- B. Replace the remote certificate with a new self-signed CA and application certificate.
- C. Replace the expired CA certificate to permanently resolve the problem.
- D. **Verify the remote certificate is trustworthy, and add it to the local trusted certificates repository.**

Answer: D

Explanation:

The correct answer is A. Verify the remote certificate is trustworthy, and add it to the local trusted certificates repository because the error clearly indicates that the system does not recognize the certificate authority (CA) that issued the server's SSL/TLS certificate. This is a trust issue, not necessarily a problem with the certificate itself.

When `wget` reports that the certificate "is not trusted" and "does not have a known issuer," it typically means the CA certificate is missing from the local trust store. The proper and secure resolution is to first validate that the remote certificate is legitimate (for example, confirming it with the issuing authority or organization).

Once verified, the administrator should add the CA certificate to the system's trusted certificate store (e.g., `/etc/pki/ca-trust/` or `/usr/local/share/ca-certificates/` depending on the distribution) and update the trust database.

Option B is incorrect because using a self-signed certificate introduces additional trust issues and is not appropriate for production environments unless properly managed.

Option C is incorrect because the error message does not indicate that the certificate is expired, only that the issuer is unknown.

Option D is incorrect because using --no-check-certificate bypasses SSL verification entirely, which creates a significant security vulnerability and violates best practices.

From a Linux+ security perspective, maintaining proper certificate validation is essential for secure communications. Administrators must ensure that trusted CAs are properly configured rather than bypassing verification mechanisms.
