100% Pass Reliable NVIDIA - NCP-AIO - NVIDIA AI Operations Valid Exam Answers

Our online staff is professionally trained and they have great knowledge on the NCP-AIO study guide. So they can clearly understand your requirements and ideas and then help you make the right choices. When you have purchased our NCP-AIO exam practice, but you do not know how to install it, we can also provide remote guidance to help you complete the installation. All in all, we will always be there to help you until you pass the NCP-AIO Exam and get a certificate.

NVIDIA AI Operations Sample Questions (Q83-Q88):

NEW QUESTION # 83

You need to configure BCM to send alerts when a GPU's temperature exceeds a critical threshold. Where would you configure this alerting policy within BCM?

- A. Through the BCM web interface, in the 'Alerting Policies' section.
- B. By creating a custom Prometheus rule and integrating it with BCM.
- C. Using the 'nvidia-smi' command-line tool to set temperature thresholds and trigger alerts.
- D. Within the DCGM configuration files on the GPU nodes.
- E. In the 'bcm_config.yaml' file.

Answer: A

Explanation:

BCM provides a dedicated 'Alerting Policies' section in its web interface where you can define rules and thresholds for various metrics, including GPU temperature. You can configure the specific threshold, the alert severity, and the notification channels (e.g., email, Slack). Other options are either not directly supported or are more complex and less integrated.

NEW QUESTION # 84

An AI model deployed through Fleet Command exhibits a vulnerability. You must urgently patch all edge devices with the updated model.

What is the fastest and safest way to accomplish this, minimizing disruption to ongoing operations?

- A. Use Fleet Command to orchestrate an over-the-air (OTA) update of the model to all devices simultaneously, potentially causing temporary service interruption.
- B. Employ a staged rollout strategy within Fleet Command, gradually updating subsets of devices while monitoring for any issues before proceeding to the entire fleet.
- C. Individually SSH into each device and manually replace the model files.
- D. Immediately shut down all edge devices to prevent further exploitation and then update the model offline.
- E. Inform users to manually download and install the patch to all edge devices.

Answer: B

Explanation:

A staged rollout provides the best balance between speed and safety. It allows for early detection of potential issues during the update process, minimizing the risk of widespread disruption. Manual intervention (A) is too slow. A simultaneous update (B) could cause a large outage if problems arise. Shutting down all devices (D) is overly disruptive. User manual install (E) is not reliable or centrally controlled.

NEW QUESTION # 85

After updating the NVIDIA drivers on your NVSwitch-connected GPU server, 'nvsml' fails to start. The log file shows the following error: 'Failed to initialize NVML'. Which of the following actions is MOST likely to resolve the issue?

- A. Reinstall the operating system.
- B. Downgrade to the previous version of the NVIDIA drivers.
- C. Increase the allocated memory to the 'nvsml' process.
- D. Ensure that the NVIDIA kernel modules are correctly loaded and that the CUDA toolkit is installed and configured properly.
- E. Disable SELinux.

Answer: D

Explanation:

NVML (NVIDIA Management Library) is a core component required for 'nvsml' to function. If NVML fails to initialize, it usually indicates a problem with the NVIDIA drivers, kernel modules, or CUDA installation. Verifying these components is the most direct way to resolve the issue. Downgrading can work but first you should verify your installation.

NEW QUESTION # 86

A system administrator needs to optimize the delivery of their AI applications to the edge. What NVIDIA platform should be used?

- A. Base Command Platform
- B. NetQ
- **C. Fleet Command**
- D. Base Command Manager

Answer: C

Explanation:

NVIDIA Fleet Command is the platform designed specifically to optimize and manage the deployment and delivery of AI applications at the edge. It enables secure and scalable orchestration of AI workloads across distributed edge devices, providing lifecycle management, remote monitoring, and updates. Fleet Command facilitates running AI applications closer to where data is generated (edge), improving latency and operational efficiency.

NEW QUESTION # 87

You are setting up a distributed training environment where data is sharded across multiple storage nodes. Which of the following strategies can minimize network traffic and improve training performance?

- A. Centralized data loading where all data is accessed from a single storage node.
- **B. Data locality: Ensuring that each compute node accesses data shards stored on the same physical storage node or a storage node within the same network segment.**
- C. Aggressively caching data in system memory on the compute nodes.
- D. Storing data in a single very large file.
- E. Using a global namespace for all data, regardless of its physical location.

Answer: B

Explanation:

Data locality minimizes network traffic by allowing compute nodes to access data shards from storage nodes that are physically close to them. Centralized data loading creates a bottleneck. A global namespace simplifies access but doesn't address network traffic. Aggressively caching helps, but relies on data already being transferred initially. A single large file negates the benefits of sharding.
