最新的 CyberOps Associate 200-201 免費考試真題 (Q285-Q290):

問題 #285
Which security model assumes an attacker within and outside of the network and enforces strict verification before connecting to any system or resource within the organization?

- A. Zero Trust
- B. Object-capability
- C. Take-Grant
- D. Biba

答案：A

解題說明：
Zero Trust security is an IT security model that requires strict identity verification for every person and device trying to access resources on a private network, regardless of whether they are sitting within or outside of the network perimeter.

問題 #286
What is the impact of false positive alerts on business compared to true positive?

- A. True positives affect security as no alarm is raised when an attack has taken place, resulting in a potential breach.
- B. False positive alerts are blocked by mistake as potential attacks affecting application availability.
- C. False positives affect security as no alarm is raised when an attack has taken place, resulting in a potential breach.
- D. True positive alerts are blocked by mistake as potential attacks affecting application availability.

答案：B

解題說明：
The log in the exhibit is generated by a firewall. It shows a deny action taken on TCP traffic, specifying the source and destination addresses and ports, which is characteristic of firewall logs. Firewalls are designed to control incoming and outgoing network traffic based on predetermined security rules, and this log entry reflects the enforcement of such a rule.

問題 #287
Which two measures are used by the defense-m-depth strategy? (Choose two)

- A. Divide the network into parts
- B. Bridge the single connection into multiple.
- C. Split packets into pieces.
- D. Reduce the load on network devices.
- E. Implement the patch management process

答案：A,E

解題說明：
The defense-in-depth strategy is a layered approach to security that includes multiple defensive measures to protect against threats. Dividing the network into parts (B) helps isolate potential breaches, making it harder for an attacker to move laterally across the network. Implementing the patch management process (E) ensures that systems are up-to-date with the latest security patches, reducing vulnerabilities that attackers could exploit.

問題 #288
A SOC analyst is investigating an incident that involves a Linux system that is identifying specific sessions. Which identifier tracks an active program?

- A. active process identification number
- B. application identification number
- C. runtime identification number
- D. process identification number

答案：D

問題 #289
When communicating via TLS, the client initiates the handshake to the server and the server responds back with its certificate for identification.
Which information is available on the server certificate?

- A. trusted CA name, cipher suites, and private key
- B. server name, trusted CA, and public key
- C. server name, trusted subordinate CA, and private key
- D. trusted subordinate CA, public key, and cipher suites

答案：B

解題說明：
When communicating via TLS, part of the handshake process involves presenting a certificate containing the server name, the name of the trusted CA that issued the certificate, and the public key of the server. The client can verify the validity of the certificate and use the public key to encrypt the data sent to the server. Reference:= Cisco Cybersecurity Source Documents
