WGU Cloud Deployment and Operations Sample Questions (Q63-Q68):

NEW QUESTION # 63

(Which solution should be used to host content to be processed for Amazon Made?)

- A. DocumentDB
- B. DynamoDB
- C. S3
- D. EC2

Answer: C

Explanation:

Amazon S3 (Simple Storage Service) should be used to host content to be processed for Amazon Made, as it provides scalable object storage ideal for storing and retrieving large amounts of data, such as media files or documents, for processing workflows. The WGU Cloud Deployment and Operations Study Guide (Section 2.1, Amazon S3) states, "S3 is the preferred solution for hosting content to be processed by services like Amazon Made, offering durable and highly available storage with support for lifecycle policies and integration with other AWS services." DocumentDB, DynamoDB, and EC2 are not designed for this content hosting purpose.

NEW QUESTION # 64

(What is used to change stacks across multiple accounts and Regions in a single operation?)

- A. Stack policies
- B. StackInstance
- C. Nested stacks
- D. StackSets

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

StackSets are used to change stacks across multiple AWS accounts and regions in a single operation, enabling centralized management of infrastructure deployments. StackSets allow administrators to create, update, or delete stacks consistently across specified accounts and regions. The WGU Cloud Deployment and Operations Study Guide (Section 5.4, StackSets) states, "StackSets provide the capability to manage and update stacks across multiple accounts and regions with a single operation, streamlining multi-region deployments." StackInstance, nested stacks, and stack policies do not support this multi-account, multi-region functionality.

NEW QUESTION # 65

(An administrator successfully accesses an EC2 instance via SSH from a local computer then stops it and starts it. Following the restart, the EC2 instance is no longer accessible. Which solution should be used to resolve the issue?)

- A. Add a route to the route table associated with the EC2 instance subnet
- B. Add a rule to the security group associated with the NIC of the EC2 instance
- C. Change the IP address used to connect to the EC2 instance
- D. Change the port used to connect to EC2 instance

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

After stopping and starting an EC2 instance, the public IP address may change (unless an Elastic IP is attached), but the security

group rules remain intact. If the instance is no longer accessible via SSH, it's likely due to an inbound rule (e.g., for port 22) not being correctly configured or applied. Adding or verifying a rule in the security group associated with the network interface (NIC) to allow SSH (port 22) from the administrator's IP resolves this. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Security Groups) states, "Stopping and starting an EC2 instance may require verifying or adding an inbound SSH rule (port 22) in the security group if connectivity is lost due to IP or rule misconfiguration." Route table or IP changes are not the primary issue here.

NEW QUESTION # 66

(A company is developing an application with the following requirements: * Amazon EC2 instances must be restricted to Free Tier-eligible types. * Instances of unapproved types must be terminated automatically. Which two services should be used? Choose 2 answers.)

- A. Launch Wizard
- B. OpsWorks
- C. Systems Manager
- D. Config

Answer: C,D

Explanation:

To meet the requirements of restricting EC2 instances to Free Tier-eligible types and automatically terminating unapproved instances, AWS Systems Manager and AWS Config should be used. Systems Manager can enforce instance compliance through automation documents that monitor and terminate non-compliant instances. AWS Config provides continuous monitoring and evaluation of resource configurations against defined rules, such as those limiting instance types to Free Tier-eligible options (e.g., t2.micro or t3.micro). The WGU Cloud Deployment and Operations Study Guide (Section 6.1, AWS Config and Systems Manager) notes, "AWS Config can be configured with a rule to detect non-Free Tier EC2 instances, while Systems Manager Automation can execute a termination script based on Config findings." OpsWorks and Launch Wizard are not designed for this specific compliance and automation use case.

NEW QUESTION # 67

(A company has deployed an application to AWS and a standby instance to its on-premises data center. The on-premises infrastructure is a scaled-down version of the AWS infrastructure. Which routing policy in Route 53 will allow the company to send 75% of the load to AWS and the remaining 25% to its on-premises infrastructure?)

- A. Weighted routing policy
- B. Failover routing policy
- C. Simple routing policy
- D. Geolocation routing policy

Answer: A

Explanation:

The weighted routing policy in Amazon Route 53 allows the company to distribute traffic with specific percentages, such as 75% to AWS and 25% to the on-premises infrastructure, by assigning weights to each resource record. This enables load balancing across hybrid environments. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53 Routing Policies) states, "Weighted routing policy assigns weights to resource record sets (e.g., 75 for AWS, 25 for on-premises), controlling the percentage of traffic directed to each endpoint." Geolocation, failover, and simple policies do not support percentage-based traffic splitting.

NEW QUESTION # 68

.....

Additionally, all operating systems also support this format. The third format is the desktop Cloud-Deployment-and-Operations Practice Exam software.
