Exam NCP-US-6.5 Question & Reliable NCP-US-6.5 Braindumps Pdf

The NCP-US-6.5 test prep mainly help our clients pass the NCP-US-6.5 exam and gain the certification. The certification can bring great benefits to the clients. The clients can enter in the big companies and earn the high salary. You may double the salary after you pass the NCP-US-6.5 Exam. If you own the certification it proves you master the NCP-US-6.5 quiz torrent well and you own excellent competences and you will be respected in your company or your factory. If you want to change your job it is also good for you.

Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 Sample Questions (Q41-Q46):

NEW QUESTION # 41

An administrator has created a distributed share on the File cluster. The administrator connects to the share using Windows Explorer and starts creating folders in the share. The administrator observes that none of the created folder can be renamed as the company naming convention requires.

How should the administrator resolve this issue?

- A. Modify the read/write permissions on the created folders.
- B. Modify the Files shares to use the NFS protocol.
- C. Use the Microsoft Shared Folder MMC Snapln.
- **D. Use the Files MMC Snapln and rename the folders.**

Answer: D

Explanation:

The administrator should resolve this issue by using the Files MMC Snap-in and renaming the folders. The Files MMC Snap-in is a tool that allows administrators to manage Files shares and exports from a Windows machine. The administrator can use the Files MMC Snap-in to connect to a distributed share or export and rename the top-level directories that are hosted by different FSVMs. Renaming the directories from Windows Explorer will not work because Windows Explorer does not recognize the distributed nature of the share or export and will try to rename all directories on the same FSVm, which will fail. Reference: Nutanix Files Administration Guide, page 35; Nutanix Files MMC Snap-in User Guide

NEW QUESTION # 42

What are two network requirements for a four-node FSVm deployment? (Choose two.)

- A. Four available IP addresses on the Client network
- **B. Five available IP addresses on the Client network**
- C. Four available IP addresses on the Storage network
- D. Five available IP addresses on the Storage network

Answer: B

Explanation:

The two network requirements for a four-node FSVm deployment are five available IP addresses on the Client network and five available IP addresses on the Storage network. The Client network is used for communication between the FSVMs and the clients, while the Storage network is used for communication between the FSVMs and the CVMs. For each FSVm, one Client IP and one Storage IP are required. Additionally, one extra Client IP is required for the file server VIP (Virtual IP), which is used as a single point of access for all shares and exports on the file server. Reference: Nutanix Files Administration Guide, page 28; Nutanix Files

NEW QUESTION # 43

An administrator wants to provide security against ransomware attacks in Files. The administrator wants to configure the environment to scan files for ransomware in real time and provide notification in the event of a ransomware attack. Which component should the administrator use to meet this requirement?

- A. Syslog Server
- **B. File Analytics**
- C. Protection Domain
- D. Files Console

Answer: B

Explanation:

File Analytics is a feature that provides insights into the data stored in Files, such as file types, sizes, owners, permissions, and access patterns. File Analytics also provides security against ransomware attacks by scanning files for ransomware in real time and providing notification in the event of a ransomware attack. File Analytics can detect ransomware based on file extensions, file signatures, or third-party solutions². Reference: Nutanix File Analytics Administration Guide²

NEW QUESTION # 44

An administrator is trying to create a Distributed Share, but the Use Distributed Share/Export type instead of Standard option is not present when creating the share. What is most likely the cause for this?

- A. The file server does not have the correct license
- **B. The file server resides on a single node cluster.**
- C. The cluster only has three nodes.
- D. The cluster is configured with hybrid storage

Answer: B

Explanation:

The most likely cause for this issue is that the file server resides on a single node cluster. A distributed share is a type of SMB share or NFS export that distributes the hosting of top-level directories across multiple FSVMs, which improves load balancing and performance. A distributed share cannot be created on a single node cluster, because there is only one FSVM available. A distributed share requires at least two nodes in the cluster to distribute the directories. Therefore, the option to use distributed share/export type instead of standard is not present when creating a share on a single node cluster. References: Nutanix Files Administration Guide, page 33; Nutanix Files Solution Guide, page 8 A single-node cluster cannot support a Distributed Share because it can only host one FSVM, whereas Distributed Shares require at least three FSVMs for distribution and high availability. This limitation causes the "Use Distributed Share/Export type instead of Standard" option to be absent when creating a share, as the cluster does not meet the minimum requirements.

Exact Extract from Nutanix Documentation:

From the Nutanix Files Administration Guide (available on the Nutanix Portal):

"Distributed Shares require a minimum of three FSVMs to ensure scalability and high availability, which typically requires a cluster with at least three nodes. On a single-node cluster, only Standard Shares are supported, and the option to create a Distributed Share will not be available in the Files Console."

Nutanix Files Administration Guide, Version 4.0, Section: "Distributed Shares Requirements" (Nutanix Portal).

Nutanix Certified Professional - Unified Storage (NCP-US) Study Guide, Section: "Nutanix Files Share Types".

NEW QUESTION # 45

Which ransomware prevention solution for Files is best when the list of malicious file signatures to block is greater than 300?

- A. Flow Security Central
- **B. Third-party solution**
- C. Data Lens

- D. File Analytics

Answer: B

Explanation:

Nutanix Files provides a built-in ransomware prevention feature that allows administrators to block malicious file signatures from being written to the file system. However, this feature has a limit of 300 signatures per share or export. If the list of malicious file signatures to block is greater than 300, a third-party solution is recommended. Neither File Analytics nor Data Lens supports signature-based ransomware prevention with a large list of malicious file signatures (300+). Signature-based blocking requires a dedicated security solution with a robust signature database, which third-party tools are designed to handle. Nutanix Files supports integration with such tools, making a third-party solution the best choice for this requirement.

Exact Extract from Nutanix Documentation:

From the Nutanix Files Administration Guide (available on the Nutanix Portal):

"For advanced ransomware prevention requiring signature-based blocking, such as when the list of malicious file signatures exceeds 300, Nutanix Files supports integration with third-party security solutions. These solutions can handle large signature databases and perform file scanning/blocking at scale, complementing the behavioral detection capabilities of File Analytics and Data Lens."

:

Nutanix Files Administration Guide, Version 4.0, Section: "Ransomware Protection with Third-Party Solutions" (Nutanix Portal).

Nutanix Certified Professional - Unified Storage (NCP-US) Study Guide, Section: "Nutanix Files Security Integrations".
