## INF-306 Learning Materials: HTML5 Application Development& INF-306 Exam braindumps

Our company always lays great emphasis on offering customers more wide range of choice on INF-306 exam questions. Now, we have realized our promise. Our website will provide you with INF-306 study materials that almost cover all kinds of official test and popular certificate. So you will be able to find what you need easily on our website for INF-306 training guide. Every INF-306 study material of our website is professional and accurate, which can greatly relieve your learning pressure and help you get the dreaming INF-306 certification.

## IT Specialist HTML5 Application Development Sample Questions (Q26-Q31):

### NEW QUESTION # 26

You need to use a flexbox so that new content you add to the container appears at the highest point on a vertical list. You want to achieve this goal without specifying an order. Which value should you use for flex- direction?

- A. row-reverse
- B. column
- C. column-reverse
- D. row

**Answer: C**

Explanation:

The correct value is column-reverse. The flex-direction property defines the main axis of a flex container and determines whether flex items are laid out horizontally, vertically, or in the reverse direction. column creates a vertical layout where items flow from the top of the container toward the bottom. If new content is appended after existing content, normal column layout places that new item later in the visual list, typically lower on the page. column-reverse preserves a vertical main axis but reverses the visual direction, so later items in the source order appear at the highest visual point of the list. This satisfies the requirement without using the order property

on individual flex items. row and row-reverse are incorrect because they create horizontal layouts, not vertical lists. The reverse-direction flex values should be used deliberately because visual order can differ from DOM order, but for this exam scenario, column-reverse is the value that places newly appended vertical content at the top. References/topics: CSS flexbox, flex-direction, main axis, column layout, reverse visual flow.

### NEW QUESTION # 27

You are creating a form that requires the category to be entered as a two- or three-letter abbreviation. The input is mandatory.

You need to configure the input validation for the form.

Complete the markup by typing into the boxes.

Note: You will receive partial credit for each correct answer.

```
<label for="category">Category ID:</label>
<input type="text" id="category" name="category" minlength="2" maxlength="3" required="" />
```

### Answer:

Explanation:

minlength , maxlength , required

Explanation:

First box: minlength

Second box: maxlength

Third box: required

The correct validation attributes are minlength, maxlength, and required. The input must accept a category abbreviation that is either two or three characters long. The minlength=" 2 " attribute enforces the lower boundary by preventing submission when the entered text contains fewer than two characters. The maxlength=" 3 " attribute enforces the upper boundary by preventing the user from entering more than three characters into the field. Since the question states that the input is mandatory, the required attribute must also be included. required is a Boolean validation attribute, so it does not need a value; its presence alone makes the field required before the form can be submitted. Together, these attributes configure basic HTML5 constraint validation directly in markup without requiring JavaScript. The completed input therefore requires a value, rejects values shorter than two characters, and limits the value to no more than three characters.

References/topics: HTML5 form validation, minlength, maxlength, required, text input constraints, mandatory form fields.

### NEW QUESTION # 28

Review the images on the left.

Complete the statements by selecting the correct option from each drop-down list.

Note: You will receive partial credit for each correct selection.

**Answer Area**

this layout is created with responsive

- flex boxes
- grid system
- relative positioning

use the  property with the value

- background-attachment
- background-clip
- background-repeat
- background-size

- auto
- contain
- cover

**Answer:**

Explanation:

## Answer Area

this layout is created with responsive

flex boxes  
grid system  
relative positioning

use the  property with the value

background-attachment  
background-clip  
background-repeat  
background-size

auto  
contain  
cover

Explanation:

First drop-down: flex boxes

Second drop-down: background-size

Third drop-down: cover

The correct layout mechanism is responsive flex boxes because the content changes from a vertical mobile arrangement to a wider multi-column layout as space becomes available. Flexbox supports this behavior naturally through flexible item sizing and wrapping, often without needing explicit media queries for every screen size. The header image must fill its visible header region on both mobile and desktop. The correct CSS property for controlling how a background image scales inside its container is background-size. The correct value is cover, because background-size: cover scales the image so that the entire container is covered while preserving the image's aspect ratio. This prevents distortion, although some cropping can occur when the image and container have different aspect ratios. contain would preserve the full image but may leave empty space. auto would use the image's intrinsic size and would not reliably fill the header area. background-attachment, background-clip, and background-repeat do not control image scaling.

## NEW QUESTION # 29

What is the effect of applying the CSS float: right property to an image?

- A. It positions the image to the right of the region and wraps text around the top, left, and bottom.
- B. It positions the image to the left and displays all of the text to the right of the image.
- C. It positions the image to the right and wraps text to the top and bottom.
- D. It positions the image to the left of the region and wraps text around the top, right, and bottom.

**Answer: A**

Explanation:

The correct answer is A. Applying float: right to an image removes the image from the normal inline flow and moves it to the right side of its containing block. Inline content, such as text, is then allowed to flow around the floated image. Because the image is anchored on the right, available text space is primarily on the left side of the image, and the text can continue above, beside, and below the floated region according to the surrounding layout. This is the classic use case for floating images within article-style content, where text wraps around a visual element rather than forcing the image to occupy an entire line. Option B is incomplete because it omits the important left-side wrapping behavior. Option C describes the opposite direction: an image floated left with text

appearing to its right. Option D also describes float: left, not float: right.  
References/topics: CSS float, floated images, text wrapping, normal flow, content positioning.

### NEW QUESTION # 30

You need to create the layout shown, which defines five content areas:

- \* Logo and page title
- \* Menu
- \* Main content area
- \* Additional content area
- \* Copyright and contact information

You define the following classes:

- A. `.grid-container { display: grid; grid-template-columns: 33% 33% 33%; grid-template-rows: 300px 500px 300px; grid-gap: 10px; background-color: orange; padding: 10px; }`
- B. `.grid-container { display: grid; grid-template-areas: "heading heading heading heading heading heading" " " menu content content content right right " " menu contact contact contact contact contact " ; grid-gap: 10px; background-color: orange; padding: 10px; }`
- C. `.grid-container { display: grid; grid-template-rows: "heading heading heading heading heading heading" " " menu content content content right right " " menu contact contact contact contact contact " ; grid-gap: 10px; background-color: orange; padding: 10px; }`
- D. `.grid-container { display: grid; grid-template-columns: "heading heading heading heading heading heading" " " menu content content content right right " " menu contact contact contact contact contact " ; grid-gap: 10px; background-color: orange; padding: 10px; }`

**Answer: B**

Explanation:

The correct answer is D because the layout shown is a named-area CSS Grid layout. The mockup contains five semantic regions: the top header area for the logo and page title, a left-side menu, a central main content area, a right-side additional content area, and a bottom copyright/contact area. In CSS Grid, this type of visual structure is defined with `grid-template-areas`, where each quoted string represents one grid row and each repeated name represents how far that area spans across columns. In option D, `heading` spans the full top row, `menu` occupies the left column across the lower rows, `content` fills the main center region, `right` fills the additional content region, and `contact` spans the bottom row to the right of the menu. Option A only defines row and column sizes and does not name the five content areas. Options B and C are invalid for this purpose because named layout strings do not belong in `grid-template-rows` or `grid-template-columns`.  
References  
/topics: CSS Grid, grid containers, display: grid, named grid areas, grid-template-areas, page layout construction.

### NEW QUESTION # 31

.....

These formats are IT Specialist PDF Questions and practice test software. The HTML5 Application Development INF-306 practice exam software is further divided into two formats. The name of these two formats is IT Specialist INF-306 desktop practice test software and web-based IT Specialist INF-306 practice test software. Both IT Specialist INF-306 practice test software is the INF-306 Practice Exam that will give you a real-time INF-306 exam preparation environment to solve all HTML5 Application Development INF-306 questions. With the IT Specialist INF-306 practice test software you can understand your weak topic areas. Later on, working on these IT Specialist INF-306 weak topic areas you can make it perfect.
