Lpi Linux Essentials Certificate Exam - version 1.6 Sample Questions (Q16-Q21):

NEW QUESTION # 16

What is true about the su command?

- A. It can only be used by the user root.
- **B. It runs a shell or command as another user.**
- C. It locks the root account in specific time frames.
- D. It is the default shell of the root account.
- E. It changes the name of the main administrator account.

Answer: B

NEW QUESTION # 17

Which of the following commands creates an archive filework.tarfrom the contents of the directory./ work/?

- A. tar work > work.tar
- B. tar -create work.tgz -content ./work/
- C. tar --new work.tar ./work/
- **D. tar -cfwork.tar ./work/**
- E. tar work.tar < ./work/

Answer: D

Explanation:

Explanation

The tar command in Linux is used to create, extract, list, and manipulate archive files¹. The -c option tells the command to create a new archive file. The -f option specifies the name of the archive file. The last argument is the name of the directory or file to be archived. Therefore, the command tar -cfwork.tar ./work/ will create an archive file named work.tar from the contents of the directory ./work/. The other options are either invalid or do not create the desired archive file. Option A uses an unrecognized option --new. Option C uses an incorrect option --content and an incorrect extension .tgz for a plain tar archive. Option D and E use an incorrect syntax for redirecting the input or output of the tar command. NEW QUESTION # 18

How is a new Linux computing instance provisioned in an IaaS cloud?

- A. The standard Linux installer has to be run through a remote console.
- **B. The cloud hosting organization provides a set of pre-prepared images of popular Linux distributions.**
- C. After buying a Linux distribution, its vendor delivers it to a cloud instance.
- D. A provider-specific configuration file describing the desired installation is uploaded to the cloud provider.
- E. The installation has to be prepared in a local virtual machine which is then copied to the cloud.

Answer: B

Explanation:

Explanation

In an Infrastructure as a Service (IaaS) cloud, the provider offers virtualized computing resources such as servers, storage, and network over the internet. The user can provision and manage these resources according to their needs. One of the common ways to provision a new Linux computing instance in an IaaS cloud is to use a pre-prepared image of a Linux distribution provided by the cloud hosting organization. An image is a snapshot of a virtual machine that contains the operating system and other software

components. The user can choose from a variety of images that suit their requirements and launch a new instance from the image. This way, the user does not have to install and configure the Linux operating system from scratch, which saves time and effort. Some examples of cloud hosting organizations that provide pre-prepared images of popular Linux distributions are Amazon Web Services (AWS), Microsoft Azure, Google Cloud Platform (GCP), and DigitalOcean. NEW QUESTION # 19

What is true about links in a Linux file system?

- A. Only the root user can create hard links.
- **B. A symbolic link can point to a file on another file system.**
- C. A hard link can only point to a directory and never to a file.
- D. When the target of the symbolic link is moved, the link is automatically updated.
- E. A symbolic link can only point to a file and not to a directory.

Answer: B

NEW QUESTION # 20

Which of the following values could be a process ID on Linux?

- A. /bin/bash
- B. 60b503cd-019e-4300-a7be-922f074ef5ce
- C. ffB
- D. /sys/pid/9a14
- **E. 0**

Answer: E

Explanation:

Explanation

A process ID on Linux is a unique integer value that identifies a running process. The process ID can range from 0 to a maximum limit, which is usually 32768 or higher, depending on the system configuration. The process ID of 0 is reserved for the kernel's idle task, and the process ID of 1 is reserved for the init system, which is the first process launched by the kernel. The process IDs are assigned sequentially to new processes, and are recycled when a process terminates. Therefore, the only valid value for a process ID among the given options is 21398, which is an integer within the possible range. The other values are not valid process IDs because they are either strings, hexadecimal numbers, or file paths, which do not match the format of a process ID on Linux.
