Snowflake SnowPro Core Certification Exam 認定 COF-C02 試験問題 (Q780-Q785):

質問 # 780

What is the benefit of using the STRIP_OUTER_ARRAY parameter with the COPY INTO <table> command when loading data from a JSON file into a table?

- A. It transforms a pivoted table into an array.
- **B. It removes the outer array structure and loads separate rows of data**
- C. It tokenizes each data string using the defined delimiters.

- D. It flattens multiple arrays into a single array.

正解: B

解説:

The STRIP_OUTER_ARRAY parameter in the COPY INTO <table> command is used when loading data from a JSON file into a table. This parameter removes the outer array structure from the JSON data and loads separate rows of data into the table.

* Understanding the STRIP_OUTER_ARRAY Parameter:

* JSON files often contain data in an array format where multiple records are nested within a single outer array.

* The STRIP_OUTER_ARRAY parameter helps in simplifying the loading process by removing this outer array, allowing each element within the array to be loaded as a separate row in the target table.

* How It Works:

* When the STRIP_OUTER_ARRAY parameter is set to TRUE, Snowflake treats each item within the outer array as an individual record.

* This eliminates the need for additional parsing or transformation steps that would otherwise be required to handle nested arrays.

* Example Usage:

FROM @my_stage/file.json

FILE_FORMAT = (TYPE = 'JSON' STRIP_OUTER_ARRAY = TRUE);

* In this example, the JSON file containing an array of objects is loaded into the table my_table.

* Each object within the array is loaded as a separate row, without the outer array structure.

* Benefits:

* Simplifies data loading: By removing the outer array, the data is directly loaded into the table without additional manipulation.

* Enhances performance: Streamlines the loading process, reducing the complexity and potential errors in handling nested JSON structures.

質問 # 781

What is the only supported character set for loading and unloading data from all supported file formats?

- A. UTF-8
- B. UTF-16
- C. ISO-8859-1
- D. WINDOWS-1253

正解: A

質問 # 782

Which governance feature is supported by all Snowflake editions?

- A. OBJECT_DEPENDENCIES View
- B. Object tags
- C. Row access policies
- D. Masking policies

正解: A

解説:

Snowflake's governance features vary across different editions, but the OBJECT_DEPENDENCIES view is supported by all Snowflake editions. This feature is part of Snowflake's Information Schema and is designed to help users understand the dependencies between various objects in their Snowflake environment.

The OBJECT_DEPENDENCIES view provides a way to query and analyze the relationships and dependencies among different database objects, such as tables, views, and stored procedures. This is crucial for governance, as it allows administrators and data engineers to assess the impact of changes, understand object relationships, and ensure proper management of data assets.

Object tags, masking policies, and row access policies are more advanced features that offer fine-grained data governance capabilities such as tagging objects for classification, dynamically masking sensitive data based on user roles, and controlling row-level access to data. These features may have varying levels of support across different Snowflake editions, with some features being exclusive to higher-tier editions.

質問 # 783

Which of the following Snowflake objects can be shared using a secure share? (Select TWO).

- A. Procedures
- **B. Secure User Defined Functions (UDFs)**
- **C. Tables**
- D. Sequences
- E. Materialized views

正解: B、C

解説:

Secure sharing in Snowflake allows users to share specific objects with other Snowflake accounts without physically copying the data, thus not consuming additional storage. Tables and Secure User Defined Functions (UDFs) are among the objects that can be shared using this feature. Materialized views, sequences, and procedures are not shareable objects in Snowflake.
