AP-202 exam materials cover most of knowledge points for the exam, and you can master major knowledge points. In addition, we are pass guarantee and money back guarantee if you fail to pass the exam. You can know the latest information for AP-202 Exam

Materials through the update version, since we offer you free update for one year, and the update version for AP-202 exam dumps will be sent your email address automatically.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q127-Q132):

NEW QUESTION # 127

Which two methods should a developer implement in a Lightning web component to successfully handle the subscription lifecycle of a Message Channel?

- A. `Subscribe()`
- B. `unsubscribe()`
- C. `stopListener()`
- D. `startListener()`

Answer: A,B

Explanation:

To handle the subscription lifecycle of a message channel in a Lightning web component, the developer should implement the `subscribe()` and `unsubscribe()` methods from the `lightning/messageService` module. The `subscribe()` method returns a subscription object that represents the connection to the message channel. The developer can use this object to unsubscribe from the message channel later. The `unsubscribe()` method takes a subscription object as a parameter and removes the listener from the message channel. The developer should call the `unsubscribe()` method when the component is disconnected from the DOM, such as in the `disconnectedCallback()` lifecycle hook, to avoid memory leaks and performance issues.

The other options are not correct because:

B) `stopListener()` is not a valid method for handling the subscription lifecycle of a message channel. There is no such method in the `lightning/messageService` module or the Lightning web component framework.

C) `startListener()` is not a valid method for handling the subscription lifecycle of a message channel. There is no such method in the `lightning/messageService` module or the Lightning web component framework.

Subscribe and Unsubscribe from a Message Channel

Lifecycle Hooks

Use message channel in both direction

NEW QUESTION # 128

Which service method should be overridden in order to allow "without sharing" queries?

- A. `ccrz.ccService.query()`
- B. `ccrz.ccAPI.queryService()`
- C. `ccrz.ccService.initSVCDAO()`
- D. `ccrz.ccService.queryWithoutSharing()`

Answer: C

Explanation:

The service method that should be overridden in order to allow "without sharing" queries is `ccrz.ccService.initSVCDAO`. This method is responsible for initializing the service data access object (SVCDAO) that is used by the service class to perform queries. By overriding this method, the user can specify the sharing mode of the SVCDAO, which will determine whether the queries respect or ignore the sharing rules of the current user. For example, `ccrz.ccService.initSVCDAO(ccrz.ccAPI.SZ_WITHOUTSHARING)` will initialize the SVCDAO with the without sharing mode. Salesforce B2B Commerce and D2C Commerce Developer Guide, Service Classes, ccService Class

NEW QUESTION # 129

The `ccUtil` apex class in Salesforce B2B Commerce provides numerous utility functions that can be leveraged in subscriber classes. What are two ways to check the input or return data of the Global API's? (2 answers)

- A. `ccrz.ccUtil.isNotEmpty(Map<String, Object>)` and `ccrz.ccUtil.isNotEmpty(List<Object>)`
- B. `ccrz.ccUtil.isValid(Map<String, Object>)` and `ccrz.ccUtil.isValid(List<Object>)`
- C. `ccrz.ccUtil.isEmpty(Map<String, Object>)` and `ccrz.ccUtil.isEmpty(List<Object>)`

- D. `ccrz.ccUtil.isValid(Map<String, Object>)` and `ccrz.ccUtil.isValid(List<Object>)`

Answer: A,C

Explanation:

The `ccUtil` apex class provides two methods to check the input or return data of the Global API's: `ccrz.ccUtil.isEmpty(Map<String, Object>)` and `ccrz.ccUtil.isNotNull(Map<String, Object>)`. These methods return true if the map is not null and contains at least one entry, or if the map is null or empty, respectively. Similarly, `ccrz.ccUtil.isEmpty(List<Object>)` and `ccrz.ccUtil.isNotNull(List<Object>)` return true if the list is not null and contains at least one element, or if the list is null or empty, respectively. These methods are useful for validating the input parameters or the output results of the Global API's.

NEW QUESTION # 130

What is a valid way of referencing the CC Cart Object whose API name is `E_Cart__c` in a SOQL query?

- A. `_Cart__c`
- B. `cloudcraze__E_Cart__c`
- C. `ccrz__E_Cart__c`
- D. `c.E_Cart__c`

Answer: C

Explanation:

A valid way of referencing the CC Cart Object whose API name is `E_Cart__c` in a SOQL query is to use `ccrz__E_Cart__c`. This is the transformed name of the object that is used by the Salesforce B2B Commerce framework. All custom objects and fields that are part of the cloudcraze managed package have the prefix `ccrz__` in their API names. For example, `SELECT Id, Name FROM ccrz__E_Cart__c` will query the CC Cart Object records. Salesforce B2B Commerce and D2C Commerce Developer Guide, Query Transformation

NEW QUESTION # 131

A product is assigned to the entitlement policy but is missing from the Price Book related to the Buyer Group. The entitlement policy has View products and View prices in catalog checked.

How will the product behave on the B2B Portal?

- A. The product will appear on the Portal with Price Unavailable status and can also be added to the cart.
- B. The product will not appear on the Portal and therefore cannot be added to the cart.
- C. The product will appear on the Portal with Price Unavailable status but cannot be added to the cart.
- D. The product will not appear on the Portal but can be searched since it is part of the entitlement policy.

Answer: B

Explanation:

The product will not appear on the Portal and therefore cannot be added to the cart. A product is assigned to the entitlement policy but is missing from the Price Book related to the Buyer Group. The entitlement policy has View products and View prices in catalog checked. An entitlement policy is a set of rules that determines which products and prices a buyer group can access in the storefront. A buyer group is a group of buyers that share the same business relationship with the seller. A price book is a collection of prices for products that are available for purchase in the storefront. A product is a record that represents an item that can be sold in the storefront. To make a product visible and purchasable in the storefront, it must be assigned to both an entitlement policy and a price book that are related to the buyer group. If a product is assigned to an entitlement policy but not to a price book, it will not appear on the Portal and therefore cannot be added to the cart, regardless of the entitlement policy settings. The product will appear on the Portal with Price Unavailable status and can also be added to the cart is not a correct answer, as it contradicts the behavior of a product that is not in a price book. The product will appear on the Portal with Price Unavailable status but cannot be added to the cart is not a correct answer either, as it also contradicts the behavior of a product that is not in a price book. The product will not appear on the Portal but can be searched since it is part of the entitlement policy is not a correct answer either, as it also contradicts the behavior of a product that is not in a price book.
