Please remember that all experiences will become your valuable asset in life. And it is never too late to learn more and something new. Just buy our Analytics-Con-201 Exam Braindumps, you will find that you can reach your dream easily.

Salesforce Certified CRM Analytics and Einstein Discovery Consultant Sample Questions (Q107-Q112):

NEW QUESTION # 107
Universal Containers has a well-defined role hierarchy in Salesforce where everyone is assigned to an appropriate node. The accounts within their instance are categorized by their demography.
An individual sales rep should be able to view all accounts that they own. In addition, sales reps should be able to see any accounts

where the value of the account demography matches the demography defined on their user record. A user could have more than one demography defined on their user record.

To meet this requirement, the CRM Analytics consultant has set up a security predicate of the existing 'Account' dataset as follows:

This, however, does not seem to be working as expected.

What is causing the issue?

- A. The security predicate needs to be updated as 'OwnerId' == "sUser.id" || 'Demography' = "$User. Demographic__c'.
- B. The Sales Rep is not provided access permission on custom field Demographic__c on the User object.
- C. The Analytics Security User is not provided access permission on custom field Demographic_c on the User object.

Answer: B

Explanation:

The issue with the security predicate not functioning as expected likely stems from a permissions issue related to the custom field Demographic__c on the User object. Here's a detailed explanation:

* Field-Level Security: If the sales reps do not have access to the Demographic__c field, the security predicate which references this field cannot execute properly as the system cannot evaluate the predicate without accessing the field.

* Permission Settings: Ensuring that the sales reps have the necessary permissions to view and use the Demographic__c field is crucial for the security predicate to function correctly.

* Data Visibility: The security model in CRM Analytics relies heavily on the underlying data permissions in Salesforce. If these permissions are not correctly configured, the expected data visibility through CRM Analytics will not be achieved.

NEW QUESTION # 108
What is a benefit of introducing a second local connector?

- A. Better deployment management between sandboxes and production environment
- B. Better maintenance by having a connector per recipe
- C. Better performance by syncing data according to the refresh necessities

Answer: C

Explanation:

Introducing a second local connector in CRM Analytics can improve performance by enabling more granular control over data syncs. By having a separate connector, different datasets or recipes can be synchronized independently based on specific refresh needs, reducing load and improving overall performance. This approach helps optimize data flow operations, especially in large-scale deployments with varying data refresh requirements.

NEW QUESTION # 109
A project team member uploads a CSV file to CRM Analytics, and they notice a few records failed during the upload. The manager wants to view the error log generated so this can be fixed and uploaded again. The manager has the CRM Analytics administrator permissionbut is unable to download the error log details.

Why is the manager unable to download the log details?

- A. They do not have the Download CRM Analytics Data permission enabled.
- B. Only the user who uploaded the external data file can download the error log.
- C. They do not have the Upload External Data to CRM Analytics permission enabled.

Answer: B

Explanation:

In CRM Analytics, when a CSV file is uploaded and errors occur during the upload process, an error log is generated. However, only the user who uploaded the external data file can download the error log, even if other users have administrative permissions. This restriction ensures that only the user responsible for the data upload can access the details to resolve the issues.

NEW QUESTION # 110
A consultant has been asked to build and embed a dashboard in a Lightning page. Users should only be able to change the

dashboard contrast and open Analytics Studio from the header of the dashboard.
How should the consultant achieve this?

- A. Deselect the "Show Share Icon" and "Enable Subscriptions" buttons.
- B. Deselect the "Enable Notifications" and "Enable Email" buttons.
- C. Deselect the "Enable Notifications" and "Enable Subscriptions" buttons.

Answer: C

NEW QUESTION # 111
A CRM Analytics consultant has prepared a CSV file to be uploaded to CRM Analytics. By mistake, one of the column headers is modified as random non-alphanumeric characters "*&**(&*(%", which went unnoticed prior to uploading the file.
What is the expected behavior of the uploaded CSV column?

- A. The column header is auto-updated to "Column" + column number.
- B. The column header Is set to *&**(&*(%.
- C. The columnheaderis prefixed with "X" upon upload.

Answer: C

Explanation:
When uploading CSV files into CRM Analytics, column headers must follow certain formatting rules.
Headers containing non-alphanumeric characters, such as "&**(&(%", will automatically be adjusted.
Specifically, if the column header starts with non-alphanumeric characters or contains such characters, CRM Analytics will prefix the header with "X" to ensure compatibility with internal naming conventions. This behavior ensures that the column can be referenced in the platform without causing errors or conflicts.

NEW QUESTION # 112
......

The Analytics-Con-201 exam is the right way to learn new in-demand skills and upgrade knowledge. After passing the Salesforce Certified CRM Analytics and Einstein Discovery Consultant (Analytics-Con-201) exam the successful candidates can gain multiple personal and professional benefits with the real Salesforce Analytics-Con-201 Exam Questions.
