## Terraform-Associate-003 Formal Test, Terraform-Associate-003 Accurate Prep Material

It is believe that employers nowadays are more open to learn new knowledge, as they realize that HashiCorp certification may be conducive to them in refreshing their life, especially in their career arena. A professional HashiCorp certification serves as the most powerful way for you to show your professional knowledge and skills. For those who are struggling for promotion or better job, they should figure out what kind of Terraform-Associate-003 test guide is most suitable for them. However, some employers are hesitating to choose. We here promise you that our Terraform-Associate-003 Certification material is the best in the market, which can definitely exert positive effect on your study. Our Terraform-Associate-003 learn tool create a kind of relaxing leaning atmosphere that improve the quality as well as the efficiency, on one hand provide conveniences, on the other hand offer great flexibility and mobility for our customers. That's the reason why you should choose us.

## HashiCorp Terraform-Associate-003 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• Create, maintain, and use Terraform modules: In this section of the exam, candidates are tested for creating a module, using a module in configuration, and topics such as refactoring an existing configuration into modules.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>• Collaborate on infrastructure as code using HCP Terraform: In this section, the topics covered include analyzing the HCP Terraform run workflow, the role of HCP Terraform workspaces and their configuration options, and the management of provider credentials in HCP Terraform.</li></ul>

Topic 3	<ul style="list-style-type: none"> <li>• Manage resource lifecycle: The section covers topics such as Initializing a configuration using terraform init and its options and generating an execution plan using terraform plan and its options. It also covers the configuration changes using Terraform Apply and its options.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>• Develop collaborative Terraform workflows: In this section, candidates are tested for their skills related to managing the Terraform binary, providers, and modules using version constraints and setting up remote states. It also covers the utilization of the Terraform workflow in automation.</li> </ul>
Topic 5	<ul style="list-style-type: none"> <li>• Develop and troubleshoot dynamic configuration: This section deals with topics such as using language features to validate configuration query providers using data sources, computing and interpolating data using HCL functions, and using meta-arguments in configuration.</li> </ul>

## HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q145-Q150):

### NEW QUESTION # 145

You're writing a Terraform configuration that needs to read input from a local file called `id_rsa.pub`. Which built-in Terraform function can you use to import the file's contents as a string?

- A. `filebase64("id_rsa.pub")`
- B. `templafefil("id_rsa.pub")`
- C. `file("id_rsa.pub")`
- D. `fileset<"id_rsa.pub")`

**Answer: C**

Explanation:

To import the contents of a local file as a string in Terraform, you can use the built-in `file` function. By specifying `file("id_rsa.pub")`, Terraform reads the contents of the `id_rsa.pub` file and uses it as a string within your Terraform configuration. This function is particularly useful for scenarios where you need to include file data directly into your configuration, such as including an SSH public key for provisioning cloud instances.

Reference = This information is a standard part of Terraform's functionality with built-in functions, as outlined in Terraform's official documentation and commonly used in various Terraform configurations.

### NEW QUESTION # 146

How would you reference the volume IDs associated with the `ebs_block_device` blocks in this configuration?

- A. `aws_instance.example.ebs_block_device[sda2,sda3].volume_id`
- B. `aws_instance.example-ebs_block_device.*.volume_id`
- C. `aws_instance.example.ebs_block_device.[*].volume_id`
- D. `aws_instance.example.ebs_block_device.volume_ids`

**Answer: B**

Explanation:

This is the correct way to reference the volume IDs associated with the `ebs_block_device` blocks in this configuration, using the `splat` expression syntax. The other options are either invalid or incomplete.

### NEW QUESTION # 147

Which of the following arguments are required when declaring a Terraform output?

- A. `default`
- B. `value`
- C. `sensitive`
- D. `description`

**Answer: B**

Explanation:

When declaring a Terraform output, the `value` argument is required. Outputs are a way to extract information from Terraform-managed infrastructure, and the `value` argument specifies what data will be outputted. While other arguments like `description` and `sensitive` can provide additional context or security around the output, `value` is the only mandatory argument needed to define an output. References= The requirement of the `value` argument for outputs is specified in Terraform's official documentation, which provides guidelines on defining and using outputs in Terraform configurations.

#### NEW QUESTION # 148

Which of these are features of Terraform Cloud? Choose two correct answers.

- A. A web-based user interface (UI)
- B. Automated infrastructure deployment visualization
- C. Automatic backups
- D. Remote state storage

**Answer: A,D**

Explanation:

Terraform Cloud includes several features designed to enhance collaboration and infrastructure management. Two of these features are:

A web-based user interface (UI): This allows users to interact with Terraform Cloud through a browser, providing a centralized interface for managing Terraform configurations, state files, and workspaces.

Remote state storage: This feature enables users to store their Terraform state files remotely in Terraform Cloud, ensuring that state is safely backed up and can be accessed by team members as needed.

#### NEW QUESTION # 149

You are using a networking module in your Terraform configuration with the name label `my-network`. In your main configuration you have the following code:

When you run `terraform validate`, you get the following error:

What must you do to successfully retrieve this value from your networking module?

- A. Define the attribute `vnet_id` as an output in the networking module
- B. Change the reference value to `my-network.outputs.vmet_id`
- C. Change the reference value to `module.my_network.outputs.vnet_id`
- D. Define the attribute `vmet_id` as a variable in the networking module

**Answer: A**

Explanation:

This is what you must do to successfully retrieve this value from your networking module, as it will expose the attribute as an output value that can be referenced by other modules or resources. The error message indicates that the networking module does not have an output value named `vnet_id`, which causes the reference to fail.

#### NEW QUESTION # 150

.....

Our company can provide the anecdote for you--our Terraform-Associate-003 study materials. Under the guidance of our Terraform-Associate-003 exam practice, you can definitely pass the exam as well as getting the related certification with the minimum time and efforts. We would like to extend our sincere appreciation for you to browse our website, and we will never let you down. The advantages of our Terraform-Associate-003 Guide materials are too many to count and you can free download the demos to have a check before purchase.
