Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q188-Q193):

NEW QUESTION # 188

Universal Containers has just initiated a project involving a large distributed development and testing team. The development team members need access to a tool to manage requirements and the testing team needs access to a tool to manage defects. Additionally, stakeholders are requesting ad-hoc status reports. What tool should an Architect recommend to support the project?

- **A. Port management tool**
- B. Code Repository
- C. Spreadsheets
- D. Wave

Answer: A

Explanation:

A Port management tool is a tool that can support a project involving a large distributed development and testing team, by providing features such as requirements management, defect tracking, collaboration, and reporting. A Port management tool can also integrate with other tools, such as code repositories, testing tools, and deployment tools, to provide a comprehensive view of the project status and progress. A Spreadsheet is not a suitable tool for managing requirements and defects, as it is prone to errors, duplication, and inconsistency. A Code Repository is a tool that stores and manages the source code of the system, but does not manage requirements and defects. Wave is a tool that provides analytics and insights on data, but does not manage requirements and defects.

NEW QUESTION # 189

What are three necessary components for establishing a governance framework? Choose 3 answers

- **A. Change Control Log**
- **B. Automated Testing**
- C. Continuous Integration
- **D. Documentation Repository**
- E. Requirements Management

Answer: A,B,D

NEW QUESTION # 190

Which two environments are appropriate for creating a managed package? Choose 2 answers

- A. Developer Pro Sandbox Org
- **B. Developer Edition Org**
- **C. Partner Developer Edition Org**
- D. Production Org with LMA

Answer: B,C

NEW QUESTION # 191

Universal Containers (UC) has noticed that unit tests are failing in production during deployments and in no other environments. Investigations have revealed that administrators are making minor changes in production without regard to dependent components. What two suggestions can the architect make to help UC discover these failing unit tests earlier?

Choose 2 answers

- **A. Train the administrators to make their changes in a special "admin changes" sandbox, and then promote to production.**
- B. Stop administrators from making all changes.
- **C. Ensure a metadata backup is committed to version control every day and a diff published to the release team.**
- D. Ask administrators to run unit tests before every change.

Answer: A,C

Explanation:

Explanation

The architect should suggest the following actions to help UC discover the failing unit tests earlier: Train the administrators to make their changes in a special "admin changes" sandbox, and then promote to production, and ensure a metadata backup is committed to version control every day and a diff published to the release team. Training the administrators to use a sandbox can help prevent direct changes to production that can break the code or the unit tests. Ensuring a metadata backup and a diff can help identify any changes that have been made to production and compare them with the source of truth.

NEW QUESTION # 192

Which two statements are accurate about why Mock objects are needed when writing test classes?

Choose 2 answers

- A. Mock can also be used on the classes that extend the batchable interface to bypass the batch jobs.
- B. Some methods are invoking long running processes, using Mock is a shortcut of bypassing the long executions.
- C. A Mock is needed whenever the code makes an HTTP callout.
- D. Using a Mock allows the test class to bypass the dependencies of other objects, methods, state, or behaviors. Therefore, the developer has total control of his own code.

Answer: C,D

Explanation:

Mock objects are needed when writing test classes to simulate the behavior of real objects or external services that are not available or accessible in the test context. Using a Mock allows the test class to bypass the dependencies of other objects, methods, state, or behaviors, and therefore, the developer has total control of their own code. This is especially useful when the code makes an HTTP callout, as the test class cannot actually call an external web service. A Mock is needed to provide a fake response for the HTTP callout. A Mock is not needed for the classes that extend the batchable interface, as the test class can use the Test.startTest and Test.stopTest methods to execute the batch jobs synchronously. A Mock is not a shortcut for bypassing long running processes, as the test class should still test the functionality and performance of the code.
