CCDAK Pdf Files & Latest CCDAK Exam Format

No matter you are a company employee or a student, you will find that our CCDAK training quiz is priced reasonably to afford. Though the price is quite low but the quality is unparalleled high. We own numerous of loyal clients that constantly bought our CCDAK Exam Braindumps and recommended them to their friends, classmates or colleagues. Besides, we give discounts to our customers from time to time. Lots of our customers prised our CCDAK practice guide a value-added product.

The CCDAK exam is created by Confluent, the company that offers an enterprise version of Kafka, and is available globally. Confluent Certified Developer for Apache Kafka Certification Examination certification exam is designed to verify Kafka developers' skills, expertise, and knowledge on various Kafka-related topics such as message distribution, stream processing, and Kafka ecosystem tools. Passing the CCDAK Exam is a significant achievement, and it shows that the developer has the practical understanding of Kafka concepts that can be used to build efficient, scalable, and reliable Kafka-based applications.

Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q86-Q91):

NEW QUESTION # 86

To continuously export data from Kafka into a target database, I should use

- **A. Kafka Connect Sink**
- B. Kafka Producer
- C. Kafka Connect Source
- D. Kafka Streams

Answer: A

Explanation:

Kafka Connect Sink is used to export data from Kafka to external databases and Kafka Connect Source is used to import from external databases into Kafka.

NEW QUESTION # 87

You have a Kafka Connect cluster with multiple connectors.

One connector is not working as expected.

How can you find logs related to that specific connector?

- A. Modify the log4j.properties file to enable connector context.
- B. Change the log level to DEBUG to have connector context information in logs.
- C. Make no change, there is no way to find logs other than by stopping all the other connectors.
- **D. Modify the log4j.properties file to add a dedicated log appender for the connector.**

Answer: D

Explanation:

To isolate logs for a specific connector, you can configure a separate logger and appender in the Connect worker's log4j.properties file, using the connector's name as the logging context.

From Kafka Connect Logging Docs:

"Kafka Connect loggers use hierarchical logger names. You can configure per-connector log levels and output files by extending log4j.properties."

* A and C change verbosity but don't separate logs.

* D is false; targeted logging is possible.

Reference: Kafka Connect > Logging and Debugging

NEW QUESTION # 88

You create a producer that writes messages about bank account transactions from tens of thousands of different customers into a topic.

* Your consumers must process these messages with low latency and minimize consumer lag

* Processing takes ~6x longer than producing

* Transactions for each bank account must be processed in order Which strategy should you use?

- A. Use a unique identifier such as a universally unique identifier (UUID) as the message key.
- B. Use the timestamp of the message's arrival as its key.
- C. Use a combination of the bank account number and the transaction timestamp as the message key.
- **D. Use the bank account number found in the message as the message key.**

Answer: D

Explanation:

To maintain message ordering per bank account, the message key must be the account number. Kafka guarantees ordering per partition, and the partition is selected based on the hash of the key.

From Kafka Producer Docs:

"All records with the same key will be sent to the same partition, and Kafka preserves the order of records in a partition." Using account number ensures:

* All messages for the same account go to the same partition

* Order is maintained

* Workload is evenly distributed if account keys are varied

Other options break ordering or introduce unnecessary randomness.
Reference:Kafka Producer Concepts > Partitions and Keys

NEW QUESTION # 89

What is the risk of increasing max.in.flight.requests.per.connection while also enabling retries in a producer?

- A. At least once delivery is not guaranteed
- B. Reduce throughput
- C. Message order not preserved
- D. Less resilient

Answer: C

Explanation:

Some messages may require multiple retries. If there are more than 1 requests in flight, it may result in messages received out of order. Note an exception to this rule is if you enable the producer settingenable.idempotence=true which takes care of the out of ordering case on its own. See<https://issues.apache.org/jira/browse/KAFKA-5494>

NEW QUESTION # 90

A consumer has auto.offset.reset=latest, and the topic partition currently has data for offsets going from 45 to 2311. The consumer group never committed offsets for the topic before. Where will the consumer read from?

- A. offset 45
- B. offset 0
- C. it will crash
- D. offset 2311

Answer: D

Explanation:

Latest means that data retrievals will start from where the offsets currently end

NEW QUESTION # 91
