The trouble can test a person's character. A bad situation can show special integrity. When to face of a difficult time, only the bravest people could take it easy. Are you a brave person? If you did not do the best preparation for your IT certification exam, can you take it easy? Yes, of course. Because you have Easy4Engine's CompTIA CAS-005 Exam Training materials. As long as you have it, any examination do not will knock you down.

## CompTIA CAS-005 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• Security Engineering: This section measures the skills of CompTIA security architects that involve troubleshooting common issues related to identity and access management (IAM) components within an enterprise environment. Candidates will analyze requirements to enhance endpoint and server security while implementing hardware security technologies. This domain also emphasizes the importance of advanced cryptographic concepts in securing systems.</li></ul>

Topic 2	<ul style="list-style-type: none"> <li>• Security Architecture: This domain focuses on analyzing requirements to design resilient systems, including the configuration of firewalls and intrusion detection systems.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>• Security Operations: This domain is designed for CompTIA security architects and covers analyzing data to support monitoring and response activities, as well as assessing vulnerabilities and recommending solutions to reduce attack surfaces. Candidates will apply threat-hunting techniques and utilize threat intelligence concepts to enhance operational security.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>• Governance, Risk, and Compliance: This section of the exam measures the skills of CompTIA security architects that cover the implementation of governance components based on organizational security requirements, including developing policies, procedures, and standards. Candidates will learn about managing security programs, including awareness training on phishing and social engineering.</li> </ul>

It is known to us that the 21st century is an information era of rapid development. Now the people who have the opportunity to gain the newest information, who can top win profit maximization. In a similar way, people who want to pass CAS-005 exam also need to have a good command of the newest information about the coming exam. However, it is not easy for a lot of people to learn more about the information about the study materials. Luckily, the CAS-005 exam dumps from our company will help all people to have a good command of the newest information. Because our company have employed a lot of experts and professors to renew and update the CAS-005 test training guide for all customer in order to provide all customers with the newest information. If you also choose the CAS-005 study questions from our company, we can promise that you will have the chance to enjoy the newest information provided by our company.

## CompTIA SecurityX Certification Exam Sample Questions (Q168-Q173):

### NEW QUESTION # 168

An organization determines existing business continuity practices are inadequate to support critical internal process dependencies during a contingency event. A compliance analyst wants the Chief Information Officer (CIO) to identify the level of residual risk that is acceptable to guide remediation activities. Which of the following does the CIO need to clarify?

- A. Appetite
- B. Likelihood
- C. Impact
- D. Mitigation

**Answer: A**

Explanation:

Risk appetite defines the level of residual risk an organization is willing to accept. The CIO must clarify this to guide remediation activities and align business continuity practices with organizational tolerance.

### NEW QUESTION # 169

Due to an infrastructure optimization plan, a company has moved from a unified architecture to a federated architecture divided by region. Long-term employees now have a better experience, but new employees are experiencing major performance issues when traveling between regions. The company is reviewing the following information:

□ Which of the following is the most effective action to remediate the issue?

- A. Restarting European region physical access control systems
- B. Creating a new user entry in the affected region for the affected employee
- C. Resyncing single sign-on application with connected security appliances
- D. Synchronizing all regions\* user identities and ensuring ongoing synchronization

**Answer: D**

Explanation:

In a federated environment divided by region, if user identities are not synchronized across regions, authentication may be slow or fail when employees travel. CAS-005 IAM guidance states that identity synchronization ensures user attributes and credentials are consistently available in all regions, reducing latency and login issues.

Option A creates separate identities, which breaks single identity management.

Option C is unrelated to the login performance issue.

### NEW QUESTION # 170

A security architect wants to configure a mail server so it maintains an updated list of IoCs and blocks known- malicious incoming emails. Which of the following will the security architect most likely need for this task?

(Select two)

- A. Webhooks
- B. Security runbook
- C. Log analyzer
- D. Threat feed API
- E. Inbox deletion code
- F. Scheduled task

**Answer: A,D**

Explanation:

To keep the mail server up to date with indicators of compromise (IoCs) and block known-malicious emails, the security architect needs mechanisms to ingest new threat intelligence and apply it dynamically. The best solutions are:

\* Threat Feed API (B): This provides automated updates from external or commercial threat intelligence providers. By integrating a threat feed, the mail server can regularly fetch IoCs such as malicious domains, IPs, or attachment hashes.

\* Webhooks (D): These allow real-time or near real-time updates when new IoCs are published. Instead of waiting for scheduled pulls, the mail server can receive push notifications with updated indicators, ensuring rapid response to evolving threats.

Other options are less effective. Log analyzers (A) assist with monitoring but don't actively update or block threats. A scheduled task (C) may automate local operations but lacks the external intelligence integration required. Inbox deletion code (E) is reactive and inefficient. A security runbook (F) defines processes but does not technically enable automated updates.

Thus, the combination of Threat Feed APIs and Webhooks provides continuous, automated IoC ingestion, reducing exposure to malicious email campaigns.

### NEW QUESTION # 171

A security analyst received a report that an internal web page is down after a company-wide update to the web browser. Given the following error message:

□ Which of the following is the best way to fix this issue?

- A. Rewriting any legacy web functions
- B. Disabling all deprecated ciphers
- C. Blocking all non-essential ports
- D. Discontinuing the use of self-signed certificates

**Answer: D**

Explanation:

The error message "NET::ERR\_CERT\_WEAK\_SIGNATURE\_ALGORITHM" indicates that the web browser is rejecting the certificate because it uses a weak signature algorithm. This commonly happens with self-signed certificates, which often use outdated or insecure algorithms.

Why Discontinue Self-Signed Certificates?

Security Compliance: Modern browsers enforce strict security standards and may reject certificates that do not comply with these standards.

Trusted Certificates: Using certificates from a trusted Certificate Authority (CA) ensures compliance with security standards and is less likely to be flagged as insecure.

Weak Signature Algorithm: Self-signed certificates might use weak algorithms like MD5 or SHA-1, which are considered insecure.

### NEW QUESTION # 172

An organization that performs real-time financial processing is implementing a new backup solution. Given the following business requirements?

- \* The backup solution must reduce the risk for potential backup compromise
- \* The backup solution must be resilient to a ransomware attack.
- \* The time to restore from backups is less important than the backup data integrity
- \* Multiple copies of production data must be maintained

Which of the following backup strategies best meets these requirements?

- A. Utilizing two connected storage arrays and ensuring the arrays constantly sync
- B. Setting up antitampering on the databases to ensure data cannot be changed unintentionally
- **C. Creating a secondary, immutable storage array and updating it with live data on a continuous basis**
- D. Enabling remote journaling on the databases to ensure real-time transactions are mirrored

**Answer: C**

Explanation:

\* A. Creating a secondary, immutable storage array and updating it with live data on a continuous basis: An immutable storage array ensures that data, once written, cannot be altered or deleted. This greatly reduces the risk of backup compromise and provides resilience against ransomware attacks, as the ransomware cannot modify or delete the backup data. Maintaining multiple copies of production data with an immutable storage solution ensures data integrity and compliance with the requirement for multiple copies.

Other options:

\* B. Utilizing two connected storage arrays and ensuring the arrays constantly sync: While this ensures data redundancy, it does not provide protection against ransomware attacks, as both arrays could be compromised simultaneously.

\* C. Enabling remote journaling on the databases: This ensures real-time transaction mirroring but does not address the requirement for reducing the risk of backup compromise or resilience to ransomware.

\* D. Setting up anti-tampering on the databases: While this helps ensure data integrity, it does not provide a comprehensive backup solution that meets all the specified requirements.
