答案：B

問題 #51

Which of the following is NOT part of the steps required by ISO/IEC 27001 that an organization must take when a nonconformity is detected?

- A. Communicate the details of the nonconformity to every employee of the organization and suspend the employee that caused the nonconformity
- B. React to the nonconformity, take action to control and correct it. and deal with its consequences
- C. Evaluate the need for action to eliminate the causes of the nonconformity so that it does not recur or occur elsewhere

答案：A

解題說明：
Explanation
According to the ISO/IEC 27001 : 2022 Lead Implementer course, the steps required by ISO/IEC 27001 that an organization must take when a nonconformity is detected are as follows1:
React to the nonconformity, take action to control and correct it, and deal with its consequences Evaluate the need for action to eliminate the causes of the nonconformity so that it does not recur or occur elsewhere Implement any action needed Review the effectiveness of the corrective action Make changes to the information security management system (ISMS) if necessary Therefore, communicating the details of the nonconformity to every employee of the organization and suspending the employee that caused the nonconformity is not part of the steps required by ISO/IEC
27001. This option is not only unnecessary, but also potentially harmful, as it could violate the principles of confidentiality, integrity, and availability of information, as well as the human rights and dignity of the employee involved2. Instead, the organization should follow the established procedures for reporting, recording, and analyzing nonconformities, and ensure that the corrective actions are appropriate, proportional, and fair3.

問題 #53

Scenario 3: Socket Inc is a telecommunications company offering mainly wireless products and services. It uses MongoDB. a document model database that offers high availability, scalability, and flexibility.

Last month, Socket Inc. reported an information security incident. A group of hackers compromised its MongoDB database, because the database administrators did not change its default settings, leaving it without a password and publicly accessible. Fortunately. Socket Inc. performed regular information backups in their MongoDB database, so no information was lost during the incident. In addition, a syslog server allowed Socket Inc. to centralize all logs in one server. The company found out that no persistent backdoor was placed and that the attack was not initiated from an employee inside the company by reviewing the event logs that record user faults and exceptions.

To prevent similar incidents in the future, Socket Inc. decided to use an access control system that grants access to authorized personnel only. The company also implemented a control in order to define and implement rules for the effective use of cryptography, including cryptographic key management, to protect the database from unauthorized access The implementation was based on all relevant agreements, legislation, and regulations, and the information classification scheme. To improve security and reduce the administrative efforts, network segregation using VPNs was proposed.

Lastly, Socket Inc. implemented a new system to maintain, collect, and analyze information related to information security threats, and integrate information security into project management.

Can Socket Inc. find out that no persistent backdoor was placed and that the attack was initiated from an employee inside the company by reviewing event logs that record user faults and exceptions? Refer to scenario 3.

- A. Yes. Socket Inc. can find out that no persistent backdoor was placed by only reviewing user faults and exceptions logs
- B. No, Socket Inc should also have reviewed event logs that record user activities
- C. No, Socket Inc. should have reviewed all the logs on the syslog server

答案：B

解題說明：
Explanation
Event logs are records of events that occur in a system or network, such as user actions, faults, exceptions, errors, warnings, or security incidents. They can provide valuable information for monitoring, auditing, and troubleshooting purposes. Event logs can be categorized into different types, depending on the source and nature of the events. For example, user activity logs record the actions performed by users, such as login, logout, file access, or command execution. User fault and exception logs record the errors or anomalies that occur due to user input or behavior, such as invalid data entry, unauthorized access attempts, or system crashes. In scenario 3, Socket Inc. used a syslog server to centralize all logs in one server, which is a good practice for log management. However, to find out that no persistent backdoor was placed and that the attack was not initiated from an employee inside the company, Socket Inc. should have reviewed not only the user fault and exception logs, but also the user activity logs. The user activity logs could reveal any suspicious or malicious actions performed by the hackers or the employees, such as creating, modifying, or deleting files, executing commands, or installing software. By reviewing both types of logs, Socket Inc. could have a more complete picture of the incident and its root cause. Reviewing all the logs on the syslog server might not be necessary or feasible, as some logs might be irrelevant or too voluminous to analyze.

問題 #54

Based on scenario 3, what would help Socket Inc. address similar information security incidents in the future?

- A. Using the MongoDB database with the default settings
- B. Using cryptographic keys to protect the database from unauthorized access
- C. Using the access control system to ensure that only authorized personnel is granted access

答案：C
