Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q10-Q15):

NEW QUESTION # 10

A Kubernetes controller automatically adds another pod replica to the resource pool in response to increased application load.

- A. Horizontal
- B. Diagonal
- C. Down
- D. Vertical

Answer: A

Explanation:

Horizontal Scaling (Scale Out): This involves adding more instances (replicas/nodes) of a resource to handle increased load. In a Kubernetes or Runtime Fabric context, when the controller adds another "pod replica," it is strictly defined as horizontal scaling. Vertical Scaling (Scale Up): This would involve increasing the size (CPU or RAM capacity) of an existing single instance/pod, rather than adding more copies of it.

Context: MuleSoft's Runtime Fabric (RTF) runs on Kubernetes and leverages this horizontal auto-scaling capability to maintain performance under high traffic.

NEW QUESTION # 11

According to the Internet Engineering Task Force (IETF), which supporting protocol does File Transfer Protocol (FTP) use for reliable communication?

- A. Hypertext Transfer Protocol (HTTP)
- B. Transmission Control Protocol (TCP)
- C. Secure Sockets Layer (SSL)
- D. Lightweight Directory Access Protocol (LDAP)

Answer: B

Explanation:

TCP (Transmission Control Protocol): FTP is an application-layer protocol that relies on TCP at the transport layer to ensure reliable, ordered, and error-checked delivery of a stream of bytes.

Mechanism: FTP establishes two TCP connections: one for control (commands) and one for data transfer.

Why others are incorrect:

UDP: Is unreliable (best effort).

HTTP: Is an alternative application protocol, not the transport layer for FTP.

LDAP: Is for directories.

NEW QUESTION # 12

A MuleSoft developer must implement an API as a Mule application, run the application locally, and execute unit tests against the running application.

- A. API Designer
- **B. Anypoint Studio**
- C. Anypoint CLI
- D. API Manager

Answer: B

Explanation:

Anypoint Studio: This is the desktop Integrated Development Environment (IDE) for MuleSoft.

Capabilities:

Implement: It provides the graphical interface to drag-and-drop connectors and configure flows.

Run Locally: It includes an embedded Mule Runtime engine, allowing developers to run and debug apps on their own machines.

Execute Unit Tests: It has MUnit fully integrated, allowing developers to run tests and see coverage reports directly in the IDE.

Why others are incorrect:

API Designer: Web-based tool for designing specs (RAML), not implementing logic or running local runtimes.

Anypoint CLI: Command-line tool for platform operations, not development/testing.

NEW QUESTION # 13

Which Exchange asset type represents configuration modules that extend the functionality of an API and enforce capabilities such as security?

- A. Connectors
- B. REST APIS
- **C. Policies**
- D. Rulesets

Answer: C

Explanation:

Policies: In Anypoint Platform, a Policy is a configuration module that intercepts requests and responses to enforce specific behaviors, such as security (OAuth, Basic Auth), traffic control (Rate Limiting), or compliance.

Exchange Asset: Policies (both out-of-the-box and custom policies built in XML) are stored as assets in Anypoint Exchange.

Why others are incorrect:

Rulesets: Usually refer to API governance rules (linting RAML).

Connectors: Used to connect to external systems (Salesforce, DB), not to enforce security on the API itself.

NEW QUESTION # 14

An organization is choosing between API-led connectivity and other integration approaches.

- A. Improved security through adoption of monolithic architectures
- **B. Increased developer productivity through self-service of API assets**
- C. Greater project predictability through tight coupling of systems
- D. Higher outcome repeatability through centralized development

Answer: B

Explanation:

The Value Proposition: A primary goal of API-led connectivity is to close the IT delivery gap. It achieves this by turning APIs into reusable Assets published to Exchange. 8 Self-Service: When assets are discoverable, other developers (e.g., Line of Business developers) can reuse them without waiting for central IT to build everything from scratch. This "Self-Service" model significantly increases overall developer productivity.

Why others are incorrect:

Tight Coupling (B): API-led promotes loose coupling. Tight coupling makes systems brittle and hard to change (Point-to-Point).

Centralized Development (C): Creates a bottleneck. API-led enables federated development.

Monolithic (D): API-led breaks monoliths into composable services (Microservices/APIs).
