

C1000-194 Prüfungsressourcen: IBM Cloud Pak for Business Automation v2024.0.0 Solution Architect - Professional & C1000-194 Reale Fragen

Die IBM C1000-194 Zertifizierungsprüfung gehört zu den beliebtesten IT-Zertifizierungen. Viele ambitionierte IT-Fachleute wollen auch IBM C1000-194 Prüfung bestehen. Viele Kandidaten sollen genügende Vorbereitungen treffen, um eine hohe Note zu bekommen und sich den Bedürfnissen des Marktes anzupassen.

IBM C1000-194 Exam Syllabus Topics:

Section	Weight	Objectives
Topic 1: Integration	21%	- Integration between internal products - External integration options
Topic 2: Business Requirements and Use Cases	22%	- Selecting appropriate components for requirements and use cases - Understanding business requirements
Topic 3: Plan and Configure	26%	- Architecture, deployment and consumption models - Component setup and configuration - Best practices for component usage - Robotic Process Automation capability - Content Services capability - Value proposition of Cloud Pak for Business Automation - Workflow capability
Topic 4: Overview and Capabilities	31%	- Decision Management capability - Process Mining capability - Insights capability - Foundational services - Common tools - Document Processing capability

C1000-194 Schulungsunterlagen & C1000-194 PDF

ITZert ist professionell und geschaffen für die breiten Kandidaten. Es ist nicht nur von hoher Qualität und guter Dienstleistungen, sondern auch ganz billig. Wenn Sie über ITZert verfügen, brauchen Sie keine Sorge um die IBM C1000-194 Zertifizierungsprüfungen machen. ITZert wird Ihnen in kürzester Zeit helfen, die IBM C1000-194 Prüfungen zu bestehen. Mit diesen Lernhilfe werden Sie näher von einem IT-Spezialisten sind.

IBM Cloud Pak for Business Automation v2024.0.0 Solution Architect -

Professional C1000-194 Prüfungsfragen mit Lösungen (Q23-Q28):

23. Frage

A customer wants to automate some of the typical operations performed in Decision Center Business Console. Which two operations can be automated using the Decision Center REST API? (Choose two.)

- A. Create operations and deployment configurations.
- B. Retrieve Rule Execution Server statistics.
- C. Build, download, or deploy a RuleApp for a deployment configuration.
- D. Create action rules and decision tables.
- E. Retrieve decision services from the repository.

Antwort: C,E

Begründung:

The correct answers are D and E. Decision Center exposes a REST API that is designed to automate decision-service lifecycle operations normally performed through the Business Console, especially in continuous deployment scenarios. The Decision Center REST API can be used to build, test, and deploy decision services, and to enforce a continuous deployment process with a programming language of choice. Rule deployment can be automated by using the Decision Center REST API, and RuleApp archives can be downloaded through programmatic APIs. Retrieving decision services from the repository is a normal repository-management operation exposed through the REST API model. Building, downloading, or deploying a RuleApp for a deployment configuration is also a supported deployment-automation scenario. Option B relates to Rule Execution Server runtime monitoring, not Decision Center Business Console automation. Options A and C are not the tested REST-automation operations in this context. Reference/topics: Decision Center REST API, decision-service repository operations, automated rule deployment, RuleApp build/download/deploy, deployment configurations.

24. Frage

How can Automation Decision Services be integrated with a remote repository?

- A. Using a local Git repository.
- B. Using a remote CVS repository.
- C. Using a remote Subversion repository.
- D. Using a remote Git repository, configured as a Git provider.

Antwort: D

Begründung:

The correct answer is D. Automation Decision Services is designed around Git-based collaboration for decision automations and decision services. Each decision automation can be connected to a remote Git repository, allowing team members to work collaboratively, isolate changes in branches, and share decision-service artifacts through a governed repository model. This supports modern change management because decision services are versioned, branched, reviewed, shared, and synchronized through Git rather than through legacy source-control technologies. CVS and Subversion are not the repository integration model used by ADS in Cloud Pak for Business Automation. A local Git repository alone is also insufficient because the integration requirement is collaboration with a remote repository configured through the platform's Git provider mechanism. In architecture terms, the Git provider becomes the persistence and collaboration backbone for decision automation assets, while Decision Designer provides the authoring experience. The repository connection also supports team development, publication, backup, and controlled promotion of decision-service changes. Reference/topics: Automation Decision Services, Decision automations, Git provider configuration, Remote Git repository, Branching and sharing decision services.

25. Frage

What is a key advantage of using FileNet for Enterprise Content Management?

- A. Scalable document repository management.
- B. Real-time analytics on documents.
- C. High-speed parallel processing.
- D. Advanced natural language processing.

Antwort: A

Begründung:

The correct answer is B. FileNet Content Manager's core enterprise value is scalable, secure, repository-based management of business content. Repository services are the core of the content platform, supporting the capture, management, storage, and retrieval of business-related digital assets. Multiple repositories, called object stores, can be created and managed within a single system to meet business requirements, and object stores can store content in databases, file systems, or S3-capable storage. This makes FileNet a strong fit for enterprise content management workloads involving large document volumes, metadata models, versioning, security, retention integration, and content-centric business applications. Advanced natural language processing may be associated with newer AI capabilities around content, but it is not the fundamental ECM advantage being tested. High-speed parallel processing is not the defining FileNet capability. Real-time analytics can be delivered by analytics components such as Business Automation Insights, not by FileNet as its primary function. FileNet's differentiator is governed, scalable document and object repository management. Reference/topics: Content Services, FileNet Content Manager, object stores, repository services, enterprise document management.

26. Frage

A financial services company needs to improve its process monitoring and decision-making capabilities.

The requirements include:

- Providing real-time visibility into process performance to identify inefficiencies and bottlenecks
- Leveraging predictive analytics to forecast potential issues and take proactive action
- Enabling dashboards for stakeholders to visualize process data and KPIs.

Which component would best meet these requirements?

- A. Automation Decision Services
- B. Business Automation Workflow
- C. Automation Workstream Services
- **D. Business Automation Insights**

Antwort: D

Begründung:

The correct component is Business Automation Insights. The requirements point directly to event processing, near-real-time visibility, KPI monitoring, dashboarding, and analytics over operational process data. Business Automation Insights processes event data so organizations can derive insights into business performance, visualize indicators in near real time, and monitor activity through Business Performance Center dashboards. In an architecture for financial-services operations, BAI receives events from automation components or custom sources, stores and processes them, and exposes performance indicators that stakeholders can use to detect bottlenecks, SLA risks, throughput issues, and exception patterns. Automation Decision Services is used to automate repeatable decisions; it does not provide the primary dashboarding and operational intelligence layer. Business Automation Workflow orchestrates tasks and processes, but it is not the specialized analytics component. Automation Workstream Services supports lightweight work coordination, not enterprise process analytics. Therefore, BAI is the best fit because it combines operational event ingestion, real-time monitoring, KPI visualization, and analytical insight for proactive process improvement. Reference/topics: Business Automation Insights, Business Performance Center, dashboards, KPIs, event processing, real-time operations monitoring.

27. Frage

Which external applications can be integrated with Business Automation Navigator?

- A. Microsoft Teams, OneDrive, and OneNote
- B. Box, Slack, and Dropbox
- C. Slack, Salesforce, and SharePoint 2013
- **D. SharePoint Online, DocuSign, and Sametime**

Antwort: D

Begründung:

The correct answer is D. Business Automation Navigator is built on the IBM Content Navigator content-user experience and supports extension through plug-ins and third-party application integration. Navigator can provide access to business applications, dashboards, content features, custom plug-ins, and third-party applications. For the specific integrations in the answer set, IBM Content Navigator documentation lists plug-ins for Microsoft SharePoint Online, DocuSign, and IBM Sametime. The SharePoint Online plug-in allows users to browse, search, and work with repository documents from Microsoft SharePoint Online. The DocuSign plug-in allows documents from an ECM repository to be sent to DocuSign for digital signing and approval. The Sametime plug-in enables chat-service integration through single sign-on configuration. The other options include products that may be

integrated through custom development or general connectors in broader ecosystems, but they are not the documented Navigator integration combination being tested. Therefore, SharePoint Online, DocuSign, and Sametime are the correct set. Reference/topics: Business Automation Navigator, IBM Content Navigator plug-ins, SharePoint Online integration, DocuSign plug-in, Sametime plug-in.

28. Frage

.....

Die Zertifizierungsantworten zur IBM C1000-194 Zertifizierungsprüfung von ITZert werden von IT-Eliten seit mehr als 10 Jahre durch ihre Forschung und Praxis gesammelt. ITZert hat viele neueste und genaueste Prüfungsunterlagen. ITZert ist für Ihren Erfolg vorhanden. Es bedeutet, dass Sie Erfolg wählen, wenn Sie ITZert wählen. Wenn Sie IBM C1000-194 Zertifizierungsprüfungen leicht bestehen wollen, ist ITZert die einzige Wahl für Sie.
