질문 # 85

Which of the following data source objects can be used for an SAP Datasphere Replication Flow? Note: There are 2 correct answers to this question.

- A. ABAP CDS view
- B. MS Azure SQL table
- C. Google Big Query dataset

- D. Oracle database table

정답: A,D

설명:

SAP Datasphere Replication Flows are designed for efficient and continuous data transfer from source systems into Datasphere. For these flows, specific types of data source objects are supported to ensure robust and reliable replication. Two common and highly supported data source objects are an ABAP CDS view (Core Data Services view) and an Oracle database table. ABAP CDS views are particularly relevant for replicating data from SAP source systems (like SAP S/4HANA or SAP ERP), as they provide a semantically rich and optimized way to access business data. Oracle database tables represent a broad category of third-party relational databases from which data can be replicated. While Datasphere offers connectivity to various cloud data warehouses like Google BigQuery or MS Azure SQL for virtual access or snapshotting, Replication Flows are typically used for continuous, high-volume data ingestion from operational databases and SAP systems using their native database tables or views like CDS views.

질문 # 86

What are some features of the out-of-the-box reporting with intelligent applications in SAP Business Data Cloud? Note: There are 2 correct answers to this question.

- A. Manual creation of artifacts across all involved components
- B. AI-based suggestions for intelligent applications in the SAP Business Data Cloud Cockpit
- C. Automated data provisioning from business application to dashboard
- D. Services for transforming and enriching data

정답: C,D

설명:

The out-of-the-box reporting capabilities with intelligent applications in SAP Business Data Cloud (BDC) are designed to streamline the analytical process and deliver immediate value. Two significant features include automated data provisioning from business application to dashboard. This means that intelligent applications handle the end-to-end flow of data, from its source in operational systems, through processing in BDC, and finally to visualization in dashboards, with minimal manual intervention. This automation ensures timely and consistent data delivery for reporting. Additionally, these intelligent applications leverage services for transforming and enriching data. As part of the pre-built logic within these applications, data is automatically transformed (e.g., aggregated, filtered) and enriched (e.g., adding calculated KPIs, combining with master data) to make it immediately suitable for reporting and analysis. This reduces the need for manual data manipulation by users, providing ready-to-consume insights.
