## Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q19-Q24):

### NEW QUESTION # 19

What is a limitation of the Network Security Groups (NSGs) in Azure?

- A. NSGs are applied only to vNICs.
- B. NSGs operate at the application layer, limiting their effectiveness in the network layer.
- C. NSGs allow the filtering of inbound traffic only.
- D. NSGs cannot be applied to individual virtual machines.

**Answer: A**

Explanation:

A limitation of NSGs is that they are applied only at the subnet level or to network interfaces (vNICs), not directly to other resources

like load balancers or application gateways. This means granular application-layer filtering is not supported, and NSGs primarily operate at Layers 3 and 4.

#### NEW QUESTION # 20

In the context of Azure Route Server, what is a primary function of the route server subnet?

- A. Acting as a dedicated subnet to host network virtual appliances (NVAs) with routing propagation capabilities
- **B. Serving as the hub for the exchange of routing information**
- C. Hosting virtual machines for routing propagation purposes
- D. Providing DNS resolution for on-premises networks

**Answer: B**

Explanation:

The route server subnet in Azure is a dedicated subnet that hosts the Azure Route Server, which functions as the hub for dynamic routing information exchange between Azure virtual networks and BGP-enabled network virtual appliances (NVAs) or on-premises routers. It enables seamless and centralized route propagation.

#### NEW QUESTION # 21

When you deploy a single FortiGate VM using the available template from the Azure Marketplace, several other resources are also created.

Which two resources, among others, are created during the process? (Choose two.)

- A. One new route table
- **B. Two virtual NICs**
- **C. One NSG for each interface**
- D. One VM Scale set

**Answer: B,C**

Explanation:

Two virtual NICs - The FortiGate Azure Marketplace template deploys the VM with at least two network interfaces: one for the external/public interface and one for the internal/private interface.

One NSG for each interface - The deployment creates separate Network Security Groups (NSGs) attached to each NIC to control inbound and outbound traffic as per Fortinet's best practices.

#### NEW QUESTION # 22

What are two characteristics of Azure standard public IP addresses? (Choose two.)

- A. They can be used with load balancers of any SKU
- **B. They can be dynamic or static**
- C. They require the configuration of NSGs for inbound traffic
- **D. They support the use of availability zones**

**Answer: B,D**

Explanation:

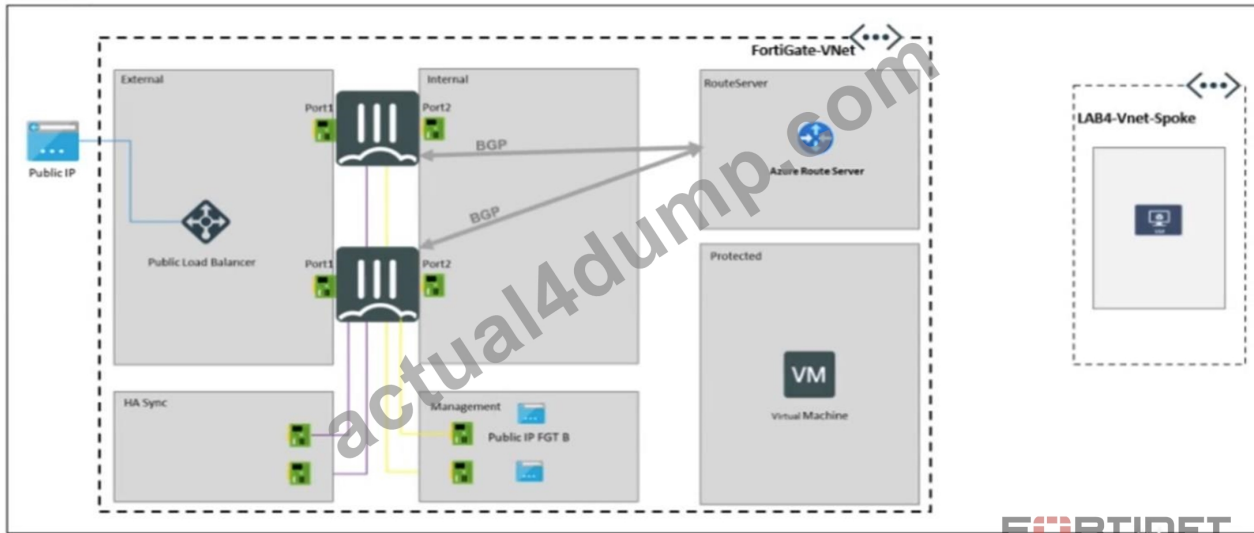

They support the use of availability zones - Standard public IP addresses are zone-redundant and support availability zone deployments for high availability.

They can be dynamic or static - Azure standard public IPs can be configured as static or dynamic, offering flexibility based on deployment needs.

#### NEW QUESTION # 23

Refer to the exhibit.

## FortiGate Active-Passive HA with ELB/ILB

An Azure Route Server and an active-passive FortiGate with Elastic Load Balancing (ELB) and Internal Load Balancing (ILB) have been deployed successfully and they are sharing and populating BGP routes in the Protected VNet.

A Linux server has been deployed in a new VNet spoke. It is expected that Azure Route Server should inject the FortiGate BGP routes into the Linux server but that failed.

How can you diagnose the problem?

- A. Review FortiGate BGP neighbors
- B. Linux server doesn't support BGP negotiation with Azure Route Server
- C. Verify the BGP setup on Azure Route Server
- D. Monitor effective routes on the Azure network interface (NIC) of the Linux server

**Answer: D**

**Explanation:**

The Linux server in the spoke VNet cannot directly peer BGP with the Azure Route Server, as it is not a BGP-enabled device. Instead, Azure propagates routes to VMs through the effective route tables associated with their network interfaces (NICs).

Therefore, to diagnose why BGP routes are not reaching the Linux VM, you should monitor the effective routes on the NIC to verify if the routes from the FortiGate (via the Route Server) are being injected properly.
