Reliable 220-1101 Exam Materials | Valid 220-1101 Exam Test

Our website offer you the latest 220-1101 dumps torrent in pdf version and test engine version, which selected according to your study habit. You can print our 220-1101 practice questions out and share the materials with your classmates and friends. The test engine version is a way of exam simulation that helps you get used to the atmosphere of 220-1101 Real Exam and solve the problems with great confidence.

CompTIA A+ Certification Exam: Core 1 Sample Questions (Q581-Q586):

NEW QUESTION # 581

A team is having issues with paper jams on a printer that the team shares with other teams. The team that is having issues prints legal-sized documents, and the other teams print letter-sized documents. Which of the following is most likely the issue?

- A. Page orientation
- B. Worn rollers
- C. Multipage misfeed
- **D. Tray settings**

Answer: D

Explanation:

The most likely issue is C. Tray settings.

Tray settings are the configuration options that tell the printer what size and type of paper is loaded in each tray. If the tray settings do not match the actual paper size and type, the printer may not be able to feed the paper correctly and cause paper jams.

In this scenario, the team that is having issues prints legal-sized documents, which are 8.5 x 14 inches, while the other teams print letter-sized documents, which are 8.5 x 11 inches. If the printer's tray settings are set to letter size by default, the printer may not recognize the legal-sized paper and try to pull it as if it were letter-sized paper. This can result in paper jams or misaligned printing. To fix this issue, the team should check and adjust the tray settings on the printer to match the paper size and type they are using. They can also use a separate tray for legal-sized paper and another tray for letter-sized paper, and make sure to select the correct tray when printing.

The other options are less likely to cause the issue, because:

*Worn rollers are the rubber parts that grip and move the paper through the printer. They can wear out over time and lose their traction, causing paper jams or misfeeds. However, worn rollers would affect all teams and all paper sizes, not just one team and one paper size.

*Page orientation is the direction of the paper, either portrait or landscape. It can affect how the document is printed on the paper, but not how the paper is fed into the printer. Page orientation can be changed in the print settings or in the document itself, but it would not cause paper jams unless the paper size is also incorrect.

*Multipage misfeed is when more than one sheet of paper is pulled into the printer at once, causing a jam.

This can happen if the paper is too thin, too thick, or too slippery, or if there is too much or too little paper in the tray. However, multipage misfeed would also affect all teams and all paper sizes, not just one team and one paper size.

NEW QUESTION # 582

A frequently used projector continuously shows a message to clean the air filters. The technician checks the filters, and they are clean. Which of the following preconfigured settings is causing the projector to show the message frequently?

- A. Temperature
- B. Image calibration
- C. Image source
- **D. Hours of use**

Answer: D

Explanation:

The message to clean the air filters, despite them being clean, is likely due to the projector's preconfigured settings related to the hours of use. Many projectors have maintenance reminders that trigger based on usage hours to prompt regular cleaning and maintenance. This reminder may need to be reset after checking or cleaning the filters. Adjusting the maintenance reminder or resetting the hours of use counter in the projector's settings can resolve the issue.

NEW QUESTION # 583

During an OS migration, a technician is unable to find compatible current software for a specialized hardware device. Which of the following actions should the technician take to complete the migration?

- A. Restrict user access.
- B. Upgrade the BIOS to UEFI.
- **C. Virtualize the application.**
- D. Replace the PC.

Answer: C

Explanation:

Virtualizing the application is the best action that a technician can take to complete the OS migration when there is no compatible current software for a specialized hardware device. Virtualizing the application means running the application in a virtual machine (VM) that emulates the previous OS environment that supports the application and the hardware device. This way, the technician can avoid the need to replace the PC or the hardware device, or to restrict user access to the application. Virtualizing the application also allows the technician to benefit from the new OS features and security updates, while maintaining the functionality and compatibility of the application and the hardware device.

The other options are not as effective or feasible for this scenario. Restricting user access may prevent unauthorized or accidental changes to the application or the hardware device, but it does not solve the compatibility issue or allow the OS migration to proceed. Replacing the PC or the hardware device may be costly, time-consuming, or impractical, especially if the hardware device is rare, expensive, or customized. Upgrading the BIOS to UEFI may improve the boot speed, security, and compatibility of the PC, but it does not guarantee that the application or the hardware device will work with the new OS.

NEW QUESTION # 584

A user complains that print jobs remain in the printer queue. A technician sends a ping command to the printer, and the printer replies successfully. The paper trays are full, and toner levels are okay. Which of the following is a reason the print jobs are getting stuck in the queue?

- A. The paper size for the last job in the queue is not available.
- **B. The first job in the queue is waiting for paper in the manual feed tray.**
- C. The print queue is unable to locate the printer.
- D. The printer is disconnected from the network.

Answer: B

Explanation:

When print jobs remain stuck in the printer queue despite successful network communication (indicated by successful ping replies) and no issues with paper supply or toner levels, a common reason can be that the first job in the queue requires manual intervention, such as paper to be fed into a manual feed tray. Printers often pause the entire print queue if the first job requires a specific type of paper or manual insertion that hasn't been addressed, preventing subsequent jobs from processing.
