CrowdStrike CCFA-200b 認定試験の出題範囲：

トピック	出題範囲
トピック 1	• Sensor Deployment: This domain focuses on verifying installation prerequisites, applying default policies and best practices, uninstalling sensors, and troubleshooting sensor issues across supported operating systems.
トピック 2	• Rules Configuration: This domain involves creating custom IOA rules, configuring exclusions to resolve false positives, managing IOC settings for threat detection, and configuring CID-wide General Settings.
トピック 3	• Host Management and Setup: This domain addresses filtering and organizing hosts, disabling detections and understanding their effects, managing Reduced Functionality Mode situations, locating inactive sensors and their retention, and utilizing relevant management reports.
トピック 4	• Group Creation: This domain covers assigning endpoints to appropriate groups for policy application and following best practices for managing host group structures.
トピック 5	• User Management: This domain covers determining appropriate roles for console access, creating and assigning roles with specific permissions, and managing API keys for platform access.

CrowdStrike CCFA-200b資格取得 & CCFA-200b受験資格

CrowdStrikeたぶん、CCFA-200b試験に合格するのが難しいと思うほど多くの受験者がいます。しかし、今では、それについて心配する必要はありません。優れた試験資料を提供するからです。当社JPNTestのCCFA-200b試験教材は非常に有用であり、テストで高得点を獲得するのに役立ちます。また、タイミングの機能と試験をシミュレートする機能が強化されるため、回答の速度を向上させ、テストの準備を完全に行うことができます。CCFA-200b試験トレントは、試験に合格し、理想的な仕事を見つけるのに役立ちます。CCFA-200b試験資料の内容についてご質問がある場合は、カスタマーサービスがオンラインで満足のいく回答を提供します。製品を購入する前に、CrowdStrike Certified Falcon Administrator - 2024 Versionガイド急流の特徴と利点を次のように詳細に理解してください。

CrowdStrike Certified Falcon Administrator - 2024 Version 認定 CCFA-200b 試験問題 (Q93-Q98):

質問 #93

Where can you find the history of the successes and failures for any Fusion SOAR workflows?

- A. Workflow Audit log
- B. Custom Alert History
- C. Workflow Execution log
- D. Falcon UI Audit Trail

正解: C

解説:

The correct location is the Workflow Execution log. Fusion SOAR separates configuration change history from workflow run history. The Workflow Audit log is used to review changes made to workflows, such as edits, versions, or modifications by users. The Execution log is the operational record of workflow activity. It shows every time workflows are triggered, along with execution date, execution status, trigger, action, and workflow name. It also allows administrators to inspect execution details, including whether the workflow completed successfully, failed, or is still in progress. The course guide states that administrators should go to Fusion workflows > Execution log to review each workflow execution and examine where a workflow may have failed. This makes it the correct source for success and failure history. Falcon UI Audit Trail is broader administrative auditing, and Custom Alert History is not the Fusion SOAR execution history location. The correct CCFA topic alignment is Workflows, specifically Fusion SOAR monitoring and execution review.

質問 #94

What are the components that must be allowed to manually install Falcon Sensor on macOS?

- A. Network filter extension and Full Disk Access only
- B. Full Disk Access and System extension only
- C. System extension, Full Disk Access, and Network filter extension
- D. Network filter extension and System extension only

正解: C

解説:

Manual macOS sensor installation requires approval for the Falcon system extension, Full Disk Access, and the network filter extension on supported macOS versions. Apple's security model requires explicit authorization before endpoint security extensions and network content filtering components can load. Full Disk Access is required for the sensor to inspect protected filesystem locations and operate correctly.

Omitting any one of these approvals can leave the sensor partially installed, unable to provide expected visibility, or unable to load required components. The course guide's macOS deployment section identifies system extension approval and network filter authorization as required for Big Sur and later, and also states Full Disk Access must be granted for proper operation.

質問 #95

In order to prevent duplicate Agent IDs, what install parameter should be used on VMs to be used as persistent clones?

- A. VDI=true
- B. ProvNoWait=1
- C. VM=True
- D. NO_START=1

正解: A

解説:

The correct parameter is VDI=true. In virtual desktop or cloned virtual machine scenarios, Falcon must avoid duplicate Agent IDs across clones. Persistent clone workflows require sensor installation to be performed with the correct VDI parameter so that each cloned endpoint registers properly and receives a unique identity.

ProvNoWait=1 is used for provisioning-timeout behavior and does not address duplicate Agent IDs.

NO_START=1 is used in some deployment contexts to delay sensor start but is not the VDI identity control.

VM=True is not the documented Falcon parameter. CCFA sensor deployment guidance treats VDI and golden-image preparation as a distinct deployment pattern because cloning a sensor incorrectly can duplicate identity and corrupt host tracking, policy assignment, and detection attribution.

質問 #96

What kind of hosts can be contained in Falcon?

- A. Only Windows and MacOS hosts running the Falcon sensor
- B. Only Windows hosts running the Falcon sensor
- C. Any host running the Falcon sensor
- D. Only Windows and Linux hosts running the Falcon sensor

正解: C

質問 #97

Even though you are a Falcon Administrator, you discover you are unable to use the "Connect to Host" feature to gather additional information which is only available on the host. Which role do you need added to your user account to have this capability?

- A. Remediation Manager
- B. Falcon Investigator
- C. Endpoint Manager
- D. Real Time Responder

正解: D

解説:

The Real Time Responder role allows users to use the "Connect to Host" feature to gather additional information from the host, such as running processes, registry keys, files, etc. The other roles do not have this capability.
