Simplified language allows candidates to see at a glance. With this purpose, our Managing-Cloud-Security learning materials simplify the questions and answers in easy-to-understand language so that each candidate can understand the test information and master it at the first time, and they can pass the test at their first attempt. Our experts aim to deliver the most effective information in the simplest language. Each candidate takes only a few days can attend to the Managing-Cloud-Security Exam. In addition, our Managing-Cloud-Security Managing-Cloud-Security provides end users with real questions and answers. We have been working hard to update the latest Managing-Cloud-Security learning materials and provide all users with the correct Managing-Cloud-Security answers. Therefore, our Managing-Cloud-Security learning materials always meet your academic requirements.

There is always a fear of losing Managing-Cloud-Security exam and this causes you loss of money and waste time. There is no such scene with PDFVCE. Your money and exam attempt is bound to award you a sure and definite success with 100% money back guarantee. You can claim for the refund of money if you do not succeed and achieve your target. Managing-Cloud-Security Exam Materials will ensure you that you will be paid back in full without any deduction. For consolidation of your learning, our WGU Managing Cloud Security (JY02) dumps also provide you sets of practice questions and answers. Doing them again and again, you enrich your knowledge and maximize chances of an outstanding Managing-Cloud-Security exam success.

For a company with history more than ten years, our Managing-Cloud-Security practice materials have developed into fully academic maturity. All content are arranged legibly. There are three kinds of Managing-Cloud-Security exam braindumps for your reference: the PDF, the Software and the APP online. All these versions of our Managing-Cloud-Security study questions are high-efficient. You can choose either one in accordance with your interests or habits.

WGU Managing Cloud Security (JY02) Sample Questions (Q107-Q112):

NEW QUESTION # 107

Which cloud computing service model allows customers to run their own application code without configuring the server environment?

- A. Data science as a service (DSaaS)
- B. Software as a service (SaaS)
- C. Infrastructure as a service (IaaS)
- **D. Platform as a service (PaaS)**

Answer: D

Explanation:

Platform as a Service (PaaS) allows customers to focus on writing and deploying code without managing the underlying infrastructure. The provider manages the operating system, runtime, and middleware, enabling faster development cycles and reduced administrative overhead.

IaaS would require the customer to configure servers and operating systems, SaaS provides ready-to-use applications, and DSaaS is a specialized category for analytics.

By abstracting the infrastructure, PaaS accelerates innovation and reduces operational burden but also limits flexibility in some cases. Security responsibilities under PaaS focus on application-level controls, while the provider handles infrastructure-level protections.

NEW QUESTION # 108

Which phase of software design covers the combination of individual components of developed code and the determination of proper interoperability?

- A. Training
- **B. Testing**
- C. Coding
- D. Planning

Answer: B

Explanation:

The phase of software design that integrates individual code components and verifies their interoperability is Testing, specifically integration testing. After developers write and unit-test individual modules, those modules must be combined into a complete system. The testing phase ensures that these modules communicate properly, data flows correctly, and overall functionality meets requirements.

Planning establishes project goals, coding builds individual components, and training prepares users. None of these directly verify interoperability. Testing is critical because even well-functioning components may fail when combined, due to interface mismatches, unexpected data structures, or dependency issues.

Cloud-based systems often integrate microservices, APIs, and third-party services. Testing validates that these distributed components interact seamlessly. Proper testing reduces defects, supports reliability, and ensures a consistent end-user experience. It also aligns with DevOps practices, where continuous integration and automated testing pipelines quickly identify and remediate interoperability issues.

NEW QUESTION # 109

Which cloud storage architecture allows the digital rights management (DRM) solutions to associate metadata with the materials in storage?

- A. File
- B. Volume
- C. Relational database
- **D. Object-based**

Answer: D

Explanation:

Object-based storage architecture allows digital rights management (DRM) solutions to associate metadata directly with stored materials. Managing Cloud documentation highlights that object storage is designed to store data as discrete objects, each containing the data itself, a unique identifier, and customizable metadata.

This metadata capability is essential for DRM solutions, as it enables the attachment of usage rights, access restrictions, expiration rules, and ownership information to digital content. Because metadata is stored alongside the object, policies can be enforced consistently regardless of where or how the data is accessed within the cloud environment.

Other storage architectures lack this flexibility. Volume and file storage focus on block-level or hierarchical file systems with limited metadata support, while relational databases require structured schemas not optimized for DRM metadata association. Object-based storage's native metadata functionality makes it the preferred architecture for enforcing content protection and rights management in the cloud.

NEW QUESTION # 110

Which group should be notified for approval when a planned modification to an environment is scheduled?

- **A. Change management board**
- B. Event management team
- C. Executive management board
- D. Problem management team

Answer: A

Explanation:

The Change Management Board (CMB), also called the Change Advisory Board (CAB), is the formal authority responsible for reviewing, assessing, and approving planned modifications to IT environments. This group ensures that proposed changes align with business objectives, do not introduce unnecessary risks, and comply with security and regulatory requirements.

Event management teams focus on monitoring events, problem management teams handle root-cause analysis, and executive boards provide strategic direction but are not operational approval authorities. Only the CMB has the explicit role of validating technical and security implications before implementation.

By involving the CMB, organizations enforce structured governance, minimize disruptions, and establish accountability. This practice is central in ITIL and ISO/IEC 20000 standards, ensuring that operational integrity and security are preserved during change cycles.

NEW QUESTION # 111

Which jurisdictional protection factor should be known if personally identifiable information (PII) is to be stored in the cloud?

- A. Physical location of load balancer
- **B. Jurisdictional location of data**
- C. Physical location of the web application firewall (WAF)
- D. Jurisdictional location of availability zone

Answer: B

Explanation:

When storing personally identifiable information (PII) in the cloud, the jurisdictional location of the data must be clearly understood. Managing Cloud principles emphasize that data is subject to the laws and regulations of the country or region where it is physically stored.

Different jurisdictions impose varying requirements for data protection, privacy, access, and disclosure.

Knowing where data resides allows organizations to assess legal obligations, compliance requirements, and potential risks associated with government access or cross-border data transfers.

The physical location of infrastructure components such as firewalls or load balancers does not determine legal jurisdiction over stored data. Availability zones may exist within a region but do not define jurisdiction independently. Therefore, the jurisdictional location of the data itself is the critical factor.
