Plat-Dev-301最新的考古題

為通過Salesforce Plat-Dev-301 認證考試花大量的時間和精力復習相關知識，但是卻是冒險地通過考試。選擇Testpdf的產品卻可以讓你花少量的錢，一次性安全通過考試。我相信在如今時間如此寶貴的社會裏，Testpdf更適合你的選擇。而且我們的Testpdf是眾多類似網站中最能給你保障的一個網站，選擇Testpdf就等於選擇了成功。

最新的 Salesforce Developer Plat-Dev-301 免費考試真題 (Q175-Q180):

問題 #175

Given the following containment hierarchy:

What is the correct way to communicate the new value of a property named "passthrough" to my-parent-component if the property is defined within my-child-component?

A)

B)

```
let cEvent = new CustomEvent('passthrough', { detail: 'this.passthrough' });  
this.dispatchEvent(cEvent);
```

C)

```
let cEvent = new CustomEvent('passthrough', {  
  detail: this.passthrough;  
});  
this.dispatchEvent(cEvent);
```

D)

- A. Option B
- B. Option D
- C. Option C
- D. Option A

答案：D

解題說明：

To communicate a property change up a containment hierarchy in Lightning Web Components (LWC), the child component should dispatch a custom event with the detail of the change. The parent component listens for this event and handles it accordingly. Option A is the correct method because it creates a new custom event with the detail property containing the new value of passthrough. This event is then dispatched, and the parent component can listen for this event to handle the updated value. Options B, C, and D are incorrect because they either don't pass any data with the event or they don't use the detail object which is the standard way to pass data with custom events in LWC.

Lightning Web Components Developer Guide - Communicating with Events

問題 #176

Refer to the following code snippets:

A developer is experiencing issues with a Lightning web component. The component must surface information about Opportunities owned by the currently logged-in user.

When the component is rendered, the following message is displayed: "Error retrieving data". Which modification should be implemented to the Apex class to overcome the issue?

- A. Ensure the OWD for the Opportunity object is Public.
- B. Use the Continuation=true attribute in the Apex method.
- C. Edit the code to use the w. cut sharing keyword in the Apex class.
- D. Use the Cacheable=true attribute in the Apex method,

答案: D

解題說明:

The @AuraEnabled(cacheable=true) attribute allows caching of method results on the client side, reducing server trips for already fetched data, which is useful for read-only data.

問題 #177

An Aura component has a section that displays some information about an Account and it works well on the desktop, but users have to scroll horizontally to see the description field output on their mobile devices and tablets.

How should a developer change the component to be responsive for mobile and tablet devices? A)

- ☐ B)
- ☐ C)
- ☐ D)

- A. Option B
- B. Option D
- C. Option C
- D. Option A

答案: D

解題說明:

To make the Aura component responsive, the developer should set multipleRows="true" to allow the layout items to wrap onto multiple rows on smaller devices. Additionally, setting the size attribute for different device sizes ensures that the layout adapts to the screen width.

問題 #178

A developer wrote a test class that successfully asserts a trigger on Account. It fires and updates data correctly in a sandbox environment.

A Salesforce admin with a custom profile attempts to deploy this trigger via a change set into the production environment, but the test class fails with an Insufficient privileges error.

What should a developer do to fix the problem?

- A. Configure the production environment to enable "Run All Tests as Admin User."
- B. Verify that Test.startTest() is not inside a For loop in the test class,
- C. Add System.runAs() to the test class to execute the trigger as a user with the correct object permissions.

- D. Add `seeAllData=true` to the test class to work within the sharing model for the production environment.

答案：C

解題說明：

When a test class fails with an "Insufficient privileges" error during deployment, it indicates that the user profile under which the tests are being executed doesn't have the necessary permissions to perform the actions required by the test. In a sandbox, the test might have been running with a different set of permissions compared to the production environment.

By using `System.runAs()`, you can specify a user context in which the test should run, which allows you to simulate the appropriate permissions. For this to work, you need to create a User instance in your test class with the profile that has the necessary permissions and then enclose the logic of your test within a `System.runAs()` block with this user.

This is a preferred solution over `seeAllData=true`, which would give the test access to all data in the production environment, potentially leading to tests that are not isolated and thus less reliable. It's also preferred over changing organization-wide settings or relying on specific setup in test classes, such as making sure `Test.startTest()` is not inside a loop.

問題 #179

Universal Containers needs to integrate with their own, existing, internal custom web application. The web application accepts JSON payloads, resizes product images, and sends the resized images back to Salesforce.

What should the developer use to implement this integration?

- A. An Apex trigger that calls an `@future` method that allows callouts
- B. A flow that calls an `@future` method that allows callouts
- C. A flow with an outbound message that contains a session ID
- D. A platform event that makes a callout to the web application

答案：A

解題說明：

In a scenario where an integration requires making a callout to an external web application, Apex is often used to perform callouts. The callout must be asynchronous when being made from a trigger because a callout cannot be made from a synchronous operation like a trigger due to the possibility of long-running transactions.

Option A (An Apex trigger that calls an `@future` method that allows callouts) is correct because it enables the trigger to perform an asynchronous callout to the external web application, which is necessary for sending JSON payloads and receiving the resized images.

Options B, C, and D do not fit the requirement as well as option A because platform events and flows are typically not used for making direct callouts to external systems in the context described.

Apex Developer Guide: Apex Web Services and Callouts

問題 #180
