NEW QUESTION # 62

U+ Bank presents various credit card offers to its customers on its website. The bank uses AI to prioritize the offers according to customer behavior. With the introduction of the Gold credit card offer, the offer click-through propensity decreased to 0.42.

What does the decrease in the propensity value most likely indicate?

- A. Similar customers show interest in the offer.
- **B. Similar customers ignore the offer.**
- C. Similar customers purchase other offers.
- D. Similar customers do not qualify for the offer.

Answer: B

Explanation:

The propensity is a measure of how likely a customer is to accept an offer, based on their attributes and behaviors. The propensity is calculated by using predictive analytics models that learn from historical data and feedback. A low propensity value indicates that the offer is not relevant or attractive for the customer, and that similar customers have ignored or rejected the offer in the past.

Therefore, if the offer click-through propensity decreased to 0.42, it most likely indicates that similar customers ignore the offer.
