By passing the exam, individuals can demonstrate their ability to effectively configure and manage the ServiceNow platform, while employers can benefit from having certified employees who can improve productivity and efficiency in their organization.

ServiceNow Certified System Administrator Sample Questions (Q435-Q440):

NEW QUESTION # 435

Which statement correctly describes the differences between a Client Script and a Business Rule?

- A. A Client Script executes on the server and a Business Rule executes on the client
- **B. A Client Script executes on the client and a Business Rule executes on the server**
- C. A Client Script executes before a record is loaded and a Business Rule executes after a record is updated
- D. A Client Script executes before a record is loaded and a Business Rule executes after a record is loaded

Answer: B

Explanation:

The fundamental difference between a Client Script and a Business Rule in ServiceNow lies in where they execute and when. A Client Script runs on the client side - that is, in the user's browser - and is primarily used to control UI behavior, validate data before submission, and enhance user interaction with forms. Client Scripts can run at different stages (onLoad, onChange, onSubmit), but they always execute within the browser environment.

A Business Rule, on the other hand, runs on the server side and executes when records are inserted, updated, deleted, or queried in the database. Business Rules are used for enforcing data integrity, automating server-side logic, and integrating with other systems. They can be set to run before or after a database action (before insert, after update, etc.).

Therefore, the correct statement is that Client Scripts execute on the client and Business Rules execute on the server.

NEW QUESTION # 436

Identify the incorrect statement about Delegated Development in ServiceNow.

- A. Administrators can grant non-admin users the ability to develop global applications.
- B. Administrators can specify which application file types the developer can access.
- C. Administrators can grant the developer access to script fields.
- **D. Administrators can grant the developer access to security records.**

Answer: D

NEW QUESTION # 437

If a user is on an Incident form and is alerted when they change the value of the Priority field, which type of script executes in the Platform?

- A. A fix script
- B. A server script
- **C. A client script**
- D. A business rule

Answer: C

Explanation:

A client script is a script that runs on the client side, meaning in the user's browser, and can manipulate the user interface or validate user input¹. A client script can be configured to run when a form is loaded, when a field value changes, or when a form is submitted². In this case, the script runs when the Priority field value changes and alerts the user.

NEW QUESTION # 438

Access Control rules are applied to a specific table, like the Incident table. What is the object name for a rule that applies to the entire Incident table (all rows and fields)?

- A. incident .!
- B. incident.None
- C. incident.all
- **D. incident .***

Answer: D

Explanation:

Explanation

The object name for a rule that applies to the entire Incident table is incident .* , which means any field on the incident table. The other options are not valid object names for access control rules.
