With our wide range of IICRC WRT exam questions types and difficulty levels, you can tailor your IICRC WRT exam practice to your needs. Your performance and exam skills will be improved with our IICRC WRT Practice Test software. The software provides you with a range of IICRC WRT exam dumps, all of which are based on past IICRC WRT certifications.

Many times getting a right method is important and more efficient than spending too much time and money in vain. Our ActualVCE team devote themselves to studying the best methods to help you pass WRT exam certification. From the time when you decide whether to purchase our WRT exam software or not, we have provided you with comprehensive guarantees, including free demo download before buying, payment guarantee in purchase process, one-year free update service after you purchased WRT Exam software, and full refund guarantee of dump cost if you fail WRT exam certification, which are all our promises to ensure customer interests.

## Free PDF 2026 WRT: High-quality Water Damage Restoration Technician (WRT) Valid Test Fee

After you pay for our WRT exam material online, you will get the link to download it in only 5 to 10 minutes. You don't have to wait a long time to start your preparation for the WRT exam. The only thing you must make sure is that you have left your right E-mail address when you purchase our WRT Study Guide. Moreover, you don't need to worry about safety in buying our WRT exam materials. We have considered all the details for you. You can just buy and download right now!

## IICRC Water Damage Restoration Technician (WRT) Sample Questions (Q74-Q79):

### NEW QUESTION # 74

What should a restorer do when there is contamination (e.g., Category 2, Category 3, Mold) on a water damage restoration project to protect workers and occupants?

- A. Call the insurance company and discuss costs
- B. Wipe down the contamination with detergent cleaner
- C. Use appropriate PPE, containment, or other engineering controls
- D. Fog a water-based disinfectant into the affected area

Answer: C

Explanation:

The IICRC WRT body of knowledge emphasizes that when contamination is present, the restorer's responsibility is to protect

workers and occupants by implementing appropriate controls. This includes the use of personal protective equipment (PPE), containment systems, and engineering or administrative controls as dictated by the hazard assessment. Category 2 and Category 3 water, as well as mold-contaminated environments, can expose individuals to microorganisms, allergens, and other harmful agents. The WRT manual reinforces the hierarchy of controls: eliminate hazards when possible, isolate hazards through containment, and protect workers with PPE when hazards cannot be fully removed. Fogging disinfectants or wiping surfaces does not eliminate airborne or surface hazards and may actually increase aerosolization if done improperly. Contacting the insurance company is an administrative step and does not mitigate health risks. The WRT curriculum also aligns with OSHA principles, stressing that safety controls must be implemented before and during restoration activities. Proper containment and PPE selection are essential to prevent cross-contamination and protect both restoration personnel and building occupants.

#### NEW QUESTION # 75

What two tools are used to properly disengage most stretched-in carpet?

- A. Base molding lifter and carpet awl
- B. Power stretcher and knee kicker
- C. Knee kicker and carpet awl
- D. Pliers and staple remover

**Answer: B**

Explanation:

The IICRC WRT body of knowledge identifies a power stretcher and knee kicker as the primary tools used to properly disengage and reinstall most stretched-in carpet systems. These tools are designed to safely release carpet from tack strips without tearing the backing or damaging the carpet edges.

A knee kicker is commonly used to disengage carpet along edges and corners by applying controlled force. A power stretcher is then used during reinstallation to properly tension the carpet across the room, preventing wrinkles, buckling, or future failure.

The WRT manual emphasizes that improper disengagement—such as pulling carpet by hand or using pliers—can cause delamination, backing damage, or seam separation. Such damage may be considered avoidable secondary damage and create liability for the restorer.

Carpet awls and molding lifters serve other purposes but are not sufficient for disengaging stretched-in carpet.

Proper tool use ensures that restorable carpet can be safely lifted for drying and returned to service when conditions allow.

#### NEW QUESTION # 76

What should a restorer do if cellulosic insulation becomes wet?

- A. Remove insulation, then dry the structure
- B. Properly dry and clean insulation
- C. Test insulation for expansion in the wall cavity
- D. Inspect insulation for an increase in R-value

**Answer: A**

Explanation:

The IICRC WRT body of knowledge identifies cellulosic insulation as a material that must be removed and discarded when wet. Cellulose insulation is highly absorbent and loses its insulating properties once saturated. It also retains moisture for extended periods, creating conditions conducive to microbial growth and secondary damage.

The WRT manual explains that wet cellulose insulation cannot be effectively dried in place due to its density and the way it traps moisture within wall cavities. Attempting to dry or clean it is unreliable and inconsistent with professional standards. Removal allows the wall cavity and surrounding materials to dry properly and be inspected for hidden damage.

Evaluating R-value or expansion is irrelevant once the insulation is wet. Reinstallation of new insulation may occur after drying is complete and conditions permit.

This guidance reflects the WRT emphasis on material restorability, moisture control, and prevention of long-term problems within concealed assemblies.

#### NEW QUESTION # 77

Which of the following is an initial method to search for moisture in surfaces such as wood flooring, gypsum wallboard, resilient flooring, ceramic tile, and plaster?

- A. Use a penetrating (invasive) moisture meter
- B. Remove one section of material
- C. Use a non-penetrating (non-invasive) moisture meter
- D. Drill small holes in the grout

**Answer: C**

Explanation:

The IICRC WRT body of knowledge identifies non-penetrating (non-invasive) moisture meters as the preferred initial method for surveying moisture in a wide range of building materials. These devices allow restorers to rapidly scan large surface areas without damaging finished materials, making them ideal for initial inspection and moisture mapping.

Non-invasive meters work by emitting electromagnetic signals that respond to changes in material density and moisture presence. While they do not provide precise moisture content values, they are effective at identifying areas of concern that warrant further investigation.

The WRT manual stresses that invasive meters, material removal, or drilling should only be performed after non-invasive methods indicate elevated readings and when confirmation is required. This tiered approach minimizes unnecessary damage while still ensuring accurate assessment.

Additionally, non-invasive meters are particularly useful on surfaces like ceramic tile or plaster, where penetrating probes may be impractical or destructive. Proper documentation requires that readings be repeatable and defensible, and starting with non-invasive tools supports both goals.

#### NEW QUESTION # 78

In a home with a Class 2 intrusion, where the floor is 1,300 square feet with an 8-foot ceiling, what is the initial recommended Pints Per Day (PPD) if using LGR dehumidifiers?

- A. 0
- B. 1
- C. 2
- D. 3

**Answer: C**

Explanation:

The IICRC WRT body of knowledge teaches that initial dehumidification capacity for LGR dehumidifiers is based on cubic footage and class of water intrusion. Class 2 intrusions involve a larger amount of moisture absorption than Class 1 but do not reach the full saturation of Class 3.

First, calculate the affected volume:

$1,300 \text{ sq ft} \times 8 \text{ ft} = 10,400 \text{ cubic feet}$ .

For Class 2 losses, a commonly accepted WRT guideline is approximately one LGR dehumidifier (#200-210 PPD) per 10,000-12,000 cubic feet. This capacity balances evaporation demand without over-drying or inefficiency.

A recommendation of 208 PPD aligns directly with this guidance and reflects standard WRT training tables used for initial equipment placement. Lower values (26 or 99 PPD) are insufficient for the moisture load, while 303 PPD exceeds the initial requirement for a Class 2 loss and would require justification through monitoring data.

The WRT manual emphasizes that this is an initial recommendation and must be validated by daily psychrometric and material moisture monitoring. Equipment may be adjusted as drying progresses.
