CrowdStrike Certified Cloud Specialist Sample Questions (Q161-Q166):

NEW QUESTION # 161

You must share remediation recommendations for an IOM in Falcon Cloud Security.

What information found within the IOM Remediation link will help your team address the misconfiguration?

- A. Total number of misconfigurations found for the related IOM policy
- **B. Related documentation from the cloud provider**
- C. Severity of the misconfiguration

Answer: B

Explanation:

The IOM Remediation link in Falcon Cloud Security provides cloud-provider-specific remediation guidance, which is the most actionable information for addressing misconfigurations. This includes direct links to official documentation from

providers such as AWS, Azure, or GCP that explain the correct configuration steps and security implications. While severity and finding counts help with prioritization, they do not tell teams how to fix the issue. Cloud provider documentation ensures remediation actions are accurate, supported, and aligned with native platform best practices. CrowdStrike intentionally includes these links to reduce friction between security and cloud operations teams, enabling faster and more reliable remediation. Therefore, the correct answer is Related documentation from the cloud provider.

NEW QUESTION # 162

Which of the following best describes the difference between managed and unmanaged items in the context of Falcon Cloud Security?

- A. Managed items refer to accounts or containers with CrowdStrike agents installed, while unmanaged items lack such direct control.
- B. Managed items are those integrated into the Falcon platform, while unmanaged items are only monitored externally.
- C. Managed items are fully patched systems, while unmanaged items are systems that have pending updates.
- D. Managed items are actively assessed for vulnerabilities, while unmanaged items are not assessed at all.

Answer: A

Explanation:

Option A: The terms managed and unmanaged do not directly relate to the patching status of systems. Both managed and unmanaged items could be fully patched or have pending updates.

Option B: Managed items refer to accounts or containers where CrowdStrike agents or direct integrations are applied, giving the Falcon platform control and visibility. Unmanaged items, by contrast, lack direct integration, meaning the platform can monitor them but not control them directly. This differentiation is critical for managing risks in hybrid environments.

Option C: Managed and unmanaged items are not defined by their vulnerability assessment status. Even unmanaged items can be assessed for risks through other tools or indirect integrations.

Option D: While managed items are integrated into the Falcon platform, unmanaged items are not merely "externally monitored." The key distinction lies in the presence or absence of direct CrowdStrike agent or integration.

NEW QUESTION # 163

An organization has deployed CrowdStrike Falcon on their cloud workloads, but they notice that real-time detection and blocking are not functioning as expected. Upon reviewing the deployment, they identify a configuration oversight.

Which of the following is the most likely reason that runtime protection is not working?

- A. The Falcon Container Sensor was installed without enabling workload protection policies.
- B. The container runtime is using an unsupported version of Docker.
- C. The Falcon sensor logs indicate no active threats were detected, meaning the deployment is successful.
- D. The cloud workload protection policies are configured to monitor but not block threats.

Answer: A

Explanation:

Option A: While some older versions of Docker may have compatibility issues, most modern Docker versions are supported by CrowdStrike Falcon. The issue is more likely a misconfiguration than a compatibility problem.

Option B: While a "monitor-only" policy can prevent blocking, it does not explain why real-time detection is not functioning. The absence of protection is likely due to a broader misconfiguration.

Option C: Even if the Falcon Sensor is installed correctly, runtime protection requires active security policies. If these policies are missing or misconfigured, the sensor will not enforce security actions, leading to ineffective threat prevention.

Option D: The absence of detected threats does not confirm that protection is working. It is possible that policies are misconfigured, and malicious activity is going unnoticed.

NEW QUESTION # 164

An organization wants to integrate their private image registry with CrowdStrike for image assessment.

What must they configure in CrowdStrike Falcon to register the connection?

- A. Open the container registry to public access for CrowdStrike to retrieve images.
- B. Install the CrowdStrike sensor on the container registry server.

- C. Use default connection settings, as CrowdStrike auto-discovers private registries.
- **D. Specify the registry URL, credentials, and authentication method in the Falcon console.**

Answer: D

Explanation:

Option A: Installing a CrowdStrike sensor on the registry server is not necessary for integrating image scanning. The connection is established through the Falcon console configuration.

Option B: CrowdStrike does not auto-discover registries. You must manually configure the connection by providing the necessary details in the Falcon console.

Option C: Opening the registry to public access is a major security risk. CrowdStrike requires proper authentication and secure communication rather than public access to perform image assessments.

Option D: The integration requires you to register the registry in the CrowdStrike Falcon console by specifying the registry's URL, credentials, and authentication method. This ensures secure communication between the registry and CrowdStrike, enabling image scanning.

NEW QUESTION # 165

Which feature of CrowdStrike Falcon Cloud Security helps detect misconfigured cloud settings that can lead to data exposure?

- A. Runtime Protection
- B. Fusion Workflows
- **C. CSPM**
- D. Sensor Update Policy

Answer: C
