1 / 5

Sie können kostenlos die Demo auf der Website Pass4Test.de herunterladen, um unsere Zuverlässigkeit zu bestätigen. Ich glaube, Sie werden sicher nicht enttäuscht sein. Die neuesten Fragen und Antworten zur Appian ACD201 Zertifizierungsprüfung von Pass4Test sind den realen Prüfungsthemen sehr ähnlich. Vielleicht haben Sie auch die einschlägige Appian ACD201 Zertifizierungsprüfung Schulungsunterlagen in anderen Büchern oder auf anderen Websites gesehen, würden Sie nach dem Vergleich finden, dass Sie doch aus Pass4Test stammen. Die Testantworten zur Appian ACD201 Zertifizierungsprüfung von Pass4Test sind umfassender, die originalen Prüfungsthemen, die von den Erfahrungsreichen Expertenteams nach ihren Erfahrungen und Kenntnissen bearbeitet, enthalten.

Appian ACD201 Prüfungsplan:

Thema	Einzelheiten
Thema 1	<ul style="list-style-type: none">• Performance and Scalability: This section of the exam measures the skills of Appian Developers and covers designing performant components, building memory-efficient models, conducting database load and automated testing, analyzing server memory and logs for risks, and resolving performance concerns for end users.

Thema 2	<ul style="list-style-type: none"> • Application Design and Development: This section of the exam measures the skills of Appian Developers and covers translating business requirements into user stories, building end-to-end applications, managing object security, applying design best practices, and ensuring user-centric experiences through proper UX design.
Thema 3	<ul style="list-style-type: none"> • Advanced Appian Concepts: This section of the exam measures the skills of Solution Architects and covers creating and configuring authentication methods, setting up integration objects, designing APIs, evaluating smart services and plug-ins, and applying SSO mechanisms with SAML and LDAP.
Thema 4	<ul style="list-style-type: none"> • Data Management: This section of the exam measures the skills of Solution Architects and covers designing and documenting data models, recommending record types for optimization and security, working with relational data, and implementing complex models with supporting objects.

ACD201 Online Prüfungen & ACD201 Prüfungsunterlagen

Wir Pass4Test bieten seit langem die entsprechenden Appian ACD201 Prüfungsunterlagen. Das ist eine Website, die von vielen Kandidaten übergeprüft. Es kann Ihnen die besten Dumps bieten. Wir Pass4Test garantieren Ihre Interesse und sind von allen gut bewertet. Wir Pass4Test sind auch Ihre zuverlässige Website auf heutigem Markt.

Appian Senior Developer ACD201 Prüfungsfragen mit Lösungen (Q72-Q77):

72. Frage

You're configuring Health Check settings under the Admin Console.

Which section would you find the setting to indicate that the Health Check will run on a Production Environment?

- A. General
- B. Scheduling
- **C. Automatic Upload**

Antwort: C

Begründung:

The Automatic Upload section in the Health Check settings of the Admin Console includes the option to indicate that the Health Check is running on a Production Environment, which helps Appian appropriately analyze and benchmark the data.

73. Frage

You need to implement a requirement where a third-party system starts a process in Appian. The third-party system can invoke a service only through Web Services Description Language (WSDL).

What should you do to start the process in Appian?

- **A. Expose process model as a web service.**
- B. Create a custom plug-in.
- C. Create a default WSDL URL using process model UUID.

Antwort: A

Begründung:

To allow a third-party system to start a process in Appian using WSDL, you should expose the process model as a web service. This generates a WSDL endpoint that the external system can invoke.

74. Frage

You need to assign a user input task to three different groups of users: Group A, Group B, and Group C.

Each task form shares some common components with the following key differences:

Group B will receive a task that includes an additional section.
Group C will only view and enter data for one section.
What should you do?

- A. Utilize conditional logic on the form along with the showWhen parameter for interface components.
- B. Configure the version setting on the user input task node to conditionally display the correct form.
- C. Within the process model, utilize an XOR gateway to conditionally select between the three different user input tasks.

Antwort: A

Begründung:

Using conditional logic with the showWhen parameter on the form allows you to display or hide specific sections for each group within a single user input task, making the solution flexible and maintainable.

75. Frage

You're creating a process to update specific fields in a list of records and you save the updated records to the database.
You're given the following performance considerations:
Execution time

appian

pass4test.de

Process instance memory usage

appian

pass4test.de

Process execution engine load balancing

appian

pass4test.de

Based on these performance metrics, rank the options from best to worst.

Note: To answer, move all steps from the Options list to the Answer List area and arrange them in the correct ranking order (best at the top, and worst at the bottom).

Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	
Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	
Within a script task, utilize an <code>ai:forEach()</code> loop to update each record in the list.	
Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.	

Antwort:

Begründung:

Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	Within a script task, utilize an <code>ai:forEach()</code> loop to update each record in the list.
Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.
Within a script task, utilize an <code>ai:forEach()</code> loop to update each record in the list.	Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.
Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.	Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.

Explanation:

Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	Within a script task, utilize an <code>ai:forEach()</code> loop to update each record in the list.
Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.	Configure a start process node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.
Within a script task, utilize an <code>ai:forEach()</code> loop to update each record in the list.	Configure a subprocess node which calls a process model to update an individual record. Configure the MNI settings to run one instance for each record in the list and to start at the same time.
Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.	Configure a synchronous subprocess node which calls a process model to update an individual record. Loop over the subprocess node for each record in the list.
