We have the specialized technicians to maintain the website at times, therefore the safety of website is guaranteed, and if you indeed encounter some problem, just contact with our service stuff, they will help you to solve the problem.

Lpi LPIC-1 Exam 101, Part 1 of 2, version 5.0 Sample Questions (Q13-Q18):

NEW QUESTION # 13

Which program runs a command in specific intervals and refreshes the display of the program's output?
(Specify ONLY the command without any path or parameters.)

Answer:

Explanation:

watch

Explanation

The program that runs a command in specific intervals and refreshes the display of the program's output is watch. This command is used to run any designated command at regular intervals and displays the output of the command on the terminal window. It is useful when you have to execute a command repeatedly and watch the command output change over time. The syntax of the watch command is:

watch [options] command

The options can modify the behavior of the watch command, such as how to format the output, how to handle signals, or how to enable color. The command is the command that you want to run and monitor. The default interval between each execution of the command is 2 seconds, but you can change it with the -n or --interval option. For more help using the watch command and its options, run `man watch` or visit [this link](#).

NEW QUESTION # 14

After successfully creating a hard link called bar to the ordinary file foo, foo is deleted from the filesystem. Which of the following describes the resulting situation?

- A. The user is prompted whether bar should be removed, too.
- **B. foo would be removed while bar would remain accessible.**
- C. Both foo and bar would remain accessible.
- D. foo and bar would both be removed.
- E. foo would be removed. bar would still exist but would be unusable.

Answer: B

Explanation:

A hard link is a directory entry that refers to the same inode as another file. An inode is a data structure that stores the metadata and the location of the data blocks of a file. A hard link allows multiple names to refer to the same file content, as long as they are on the same filesystem. Therefore, when a hard link is created, the inode reference count is increased by one, and when a hard link is deleted, the inode reference count is decreased by one. The file content is only removed from the disk when the inode reference count reaches zero, meaning that there are no more hard links to the file. In this scenario, after successfully creating a hard link called bar to the ordinary file foo, foo and bar both refer to the same inode and the same file content. The inode reference count is two. When foo is deleted from the filesystem, the inode reference count is decreased by one, but it is still one, meaning that there is still one hard link to the file. Therefore, foo would be removed while bar would remain accessible. The file content would not be removed from the disk until bar is also deleted. The other options are either incorrect or not applicable. The user is not prompted whether bar should be removed, too. The bar link would still exist and be usable, not unusable. References:
